Dear Dr. Henney,

I have been very concerned about the increased use of antibiotic in animal feed for over 20 years. My concern developed when my husband's face blew up into a distorted mess as a result of using milk after he had treatment with antibiotics for an abscessed tooth. Until that time in his life he had never needed nor used antibiotics.

It appeared that he was allergic or developed a sensitivity to the antibiotic that may

never has occurred had he not been ingesting small amounts of antibiotics in the milk he consumed over a long period.

I feel the risk/benefit of additives & the food supply is skewed in favor of the producer. What angers me ~~is~~ that the labeling laws do not require that such information as antibiotics are added to food of animals or that food I am eating is the result of genetically engineered genes added. That leaves me & the rest of us at risk and no way to make informed choices.

Sincerely,

Lynne Bloom
