Dear Commissioner Henney,

As more and more research is being conducted on Monsanto's product - BGH - the question of the actual safety of this BGH certainly becomes more + more uncertain. According to the IJAMC May 1998 article - researchers at Harvard Medical School have found conclusive evidence that IGF-1 contained in milk products from cows injected with BGH is a potent risk factor for prostrate cancer.

As Commissioner of the FDA - I'm sure you're very aware of the growing concern c BGH and therefore I'm asking you to suspend the license of Monsanto to sell BGH until it has adequately + thoroughly been proven to be safe. An entire generation of children are being fed a synthetic product that may very well have detrimental long term health effects. Please don't use our children as guinea pigs.

C 737

98P-1194

Sincerely Rebecca Bescoto RN
