

Cellular Systems Biology Profiling in Drug Discovery and Development

Kenneth A. Giuliano, Ph.D.
Principal Scientist
Cellumen, Inc.

“Optimizing Drug Discovery, Development and Clinical Trials Through Cellular Systems Biology”

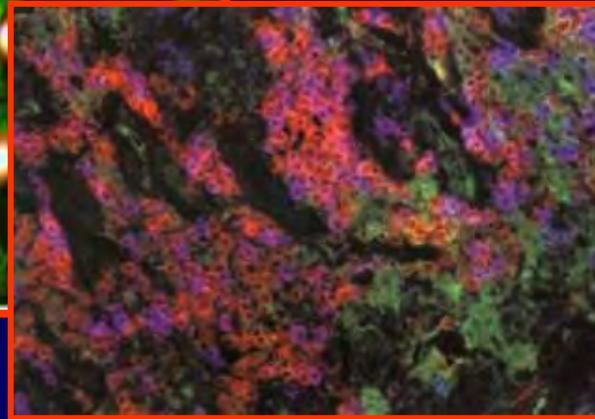

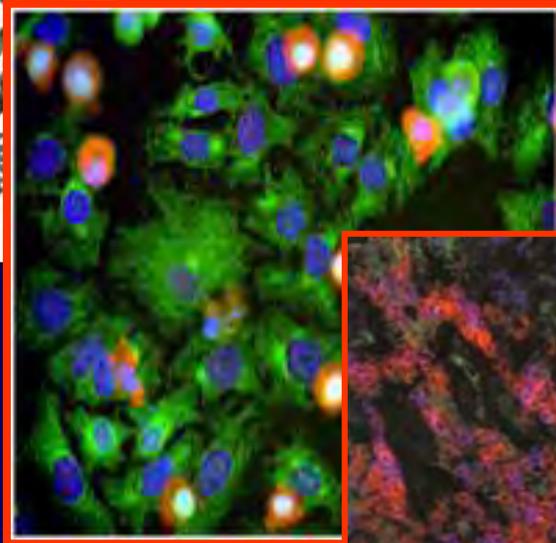

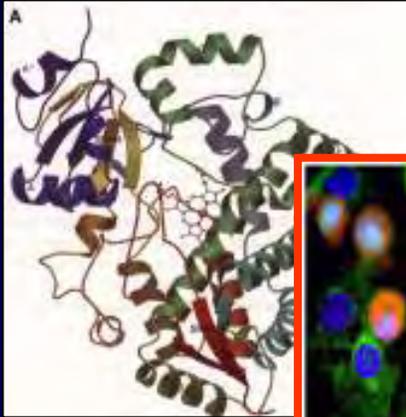

FDA/NIST Sponsored Workshop
In Vitro Analyses of Cell/Scaffold Products
December 2007

Agenda

- Introduction to Cellumen and Cellular Systems Biology
- Cytotoxicity profiling as an example application of cellular systems biology

Exploring Cells and Tissues as Systems

“From Molecules to Man”

The Challenge: Cell is An Integrated, Interacting Network

Gene Expression

Cell Surface Attachments

Membrane Receptors

Cytoskeletal Assembly-Disassembly

Membrane Pumps

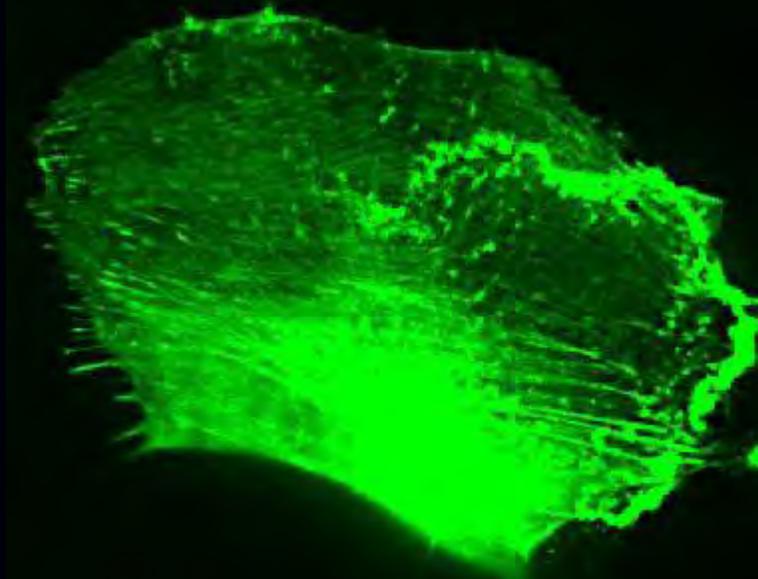

Cell Movements

Signaling Pathways

Molecular Synthesis/Degradation

Post-translational Modifications

Energy Metabolism

Evolution of Cell-based Discovery

Emergence of Cellular Systems Biology

Cell population responses

HTS methods

Whole plate readers

"Simple" HCS

Automated cellular imaging

1st generation HCS readers/1-2 features measured

Multiplexed HCS

Automated cellular imaging

3-4 features with data management

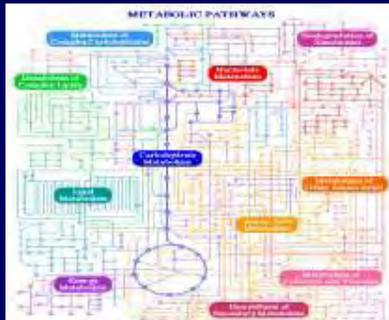

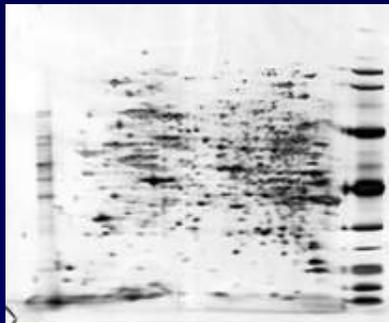

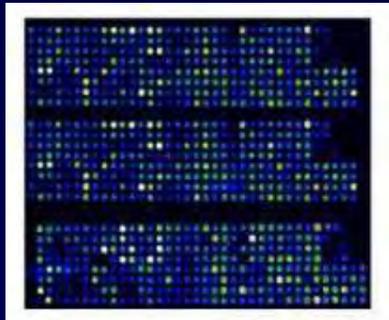

Cellular Systems Biology

Optimally multiplexed cell and tissue imaging
advanced reagents, >10 features & classifier informatics

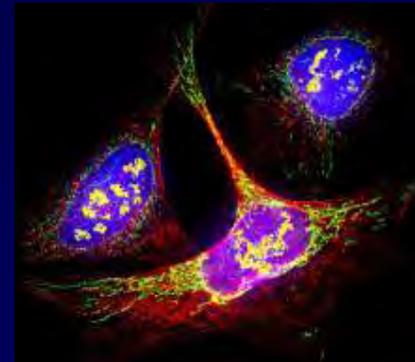

Cellular Systems Biology (CSB)TM Approach

The cell is an integrated and interacting network of genes, proteins & metabolic processes that gives rise to function

Functional Biomarkers

Cell Arrays

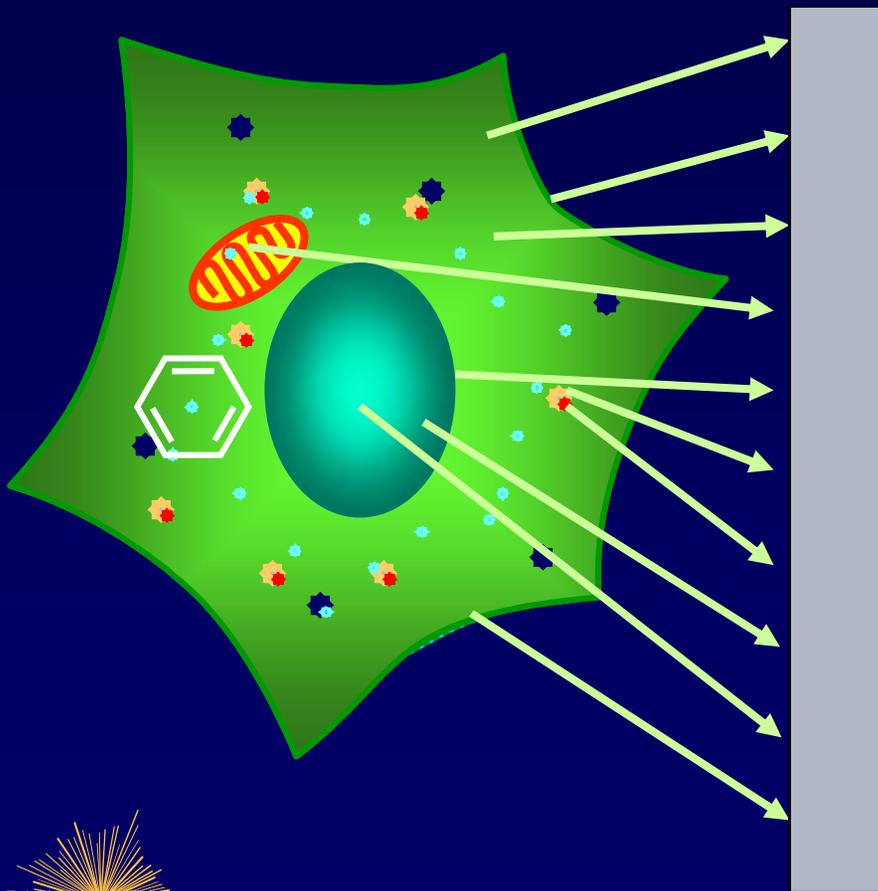

Tissue MicroArrays

“omics” Information

The Solution: Cellular Systems Biology Profiling

Proprietary Cellular
Biomarker Panels

Proprietary Profile
Database

Implementing Cellular Systems Biology (CSB)TM

Improve efficacy and decrease toxicity
of leads, clinical candidates & drugs

Cellumen Solution

CellCiphr™ Cellular Models of Disease

- Disease-relevant cellular models, biosensors, assays & profiles to improve quality and quantity of lead compounds
- Profiles & tools for important, previously intractable targets
- Flags off-target effects at the earliest stage

Cellumen Solution

CellCiphr™ Cytotoxicity Profiles

- Identifies potential toxicity before entering expensive pre-clinical testing
- Enables prioritization of lead compounds

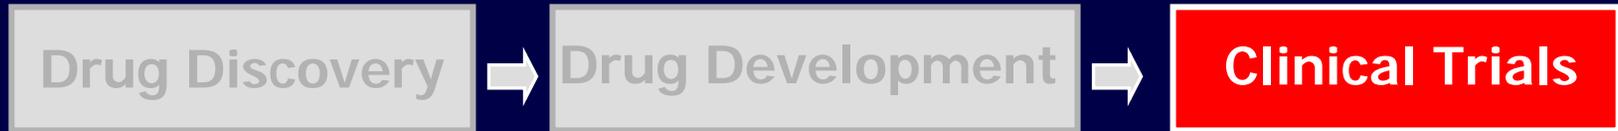

Partners

MILLIPORE

CHA

Cellumen Solution

CellCiphr™ Patient Sample Profile R&D

- Improves trial enrollment and therefore new drug candidate efficacy by stratifying patients with profiles of the patient's own samples
- Proprietary panels of cellular biomarkers can also serve as diagnostic tools to improve treatment selection

Collaborative Partner

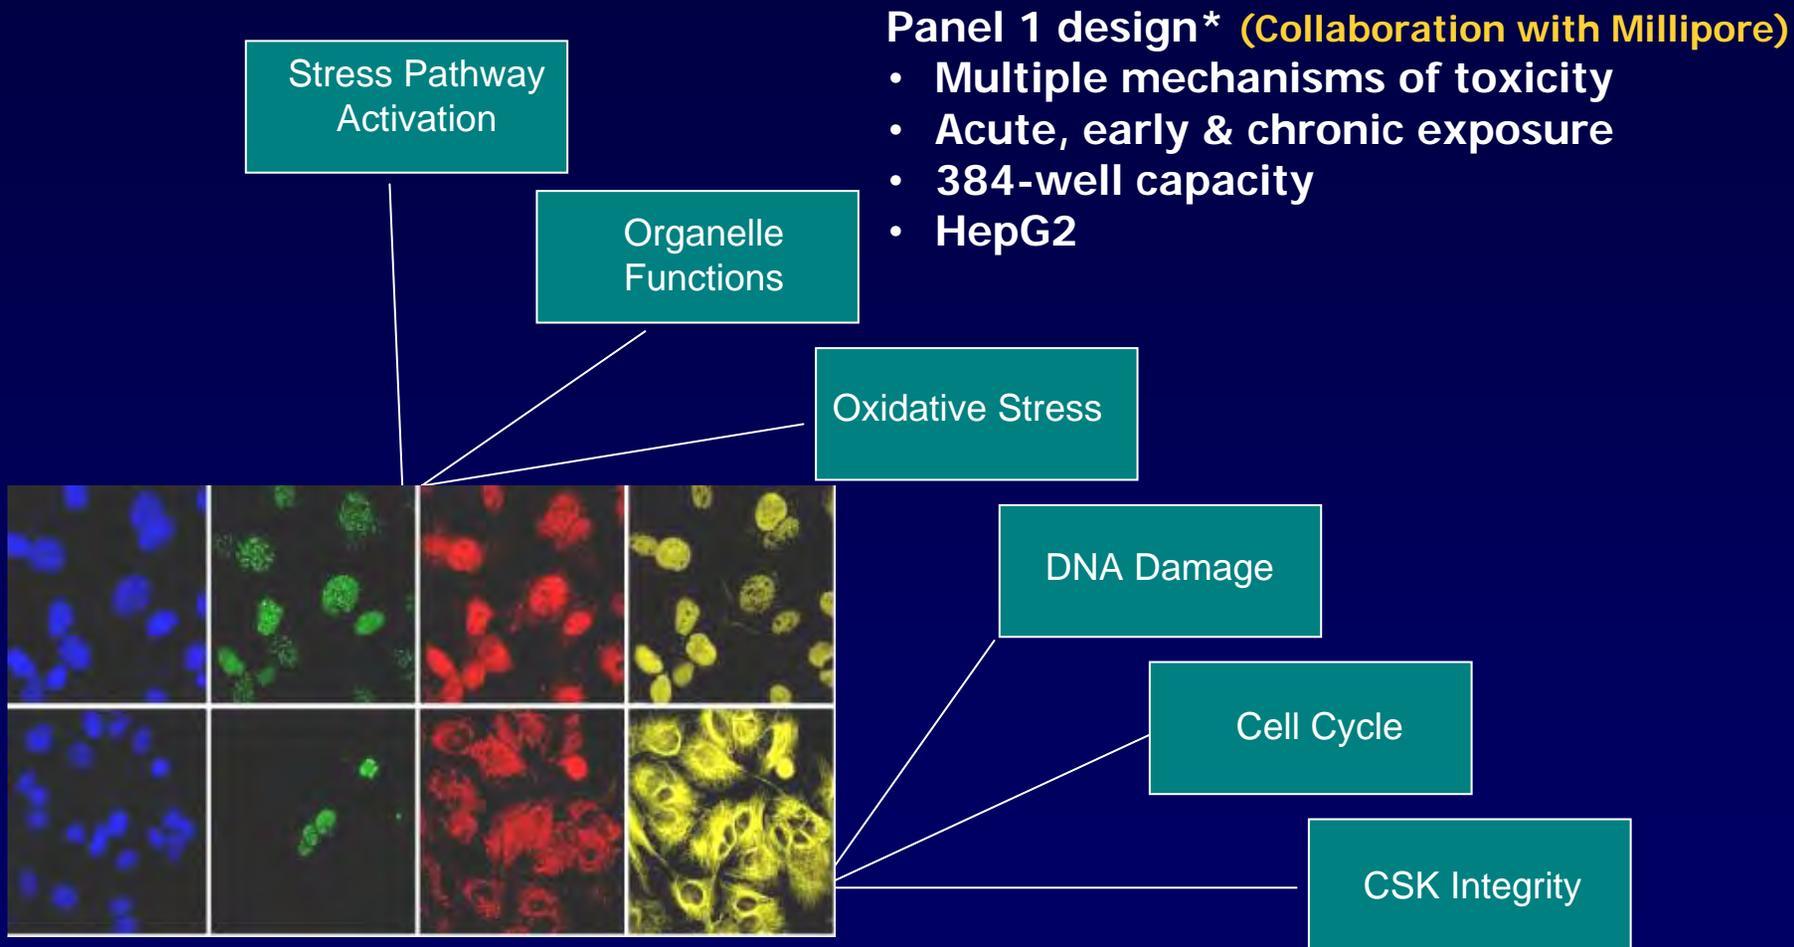

CellCiphr™ Cytotoxicity Profile

CellCiphr™ Advantages:

- Systems Biology approach monitors multiple functions, time points and doses
- Fully leverages the sensitivity and throughput of HCS
- Validated to HTS standards with 384-well capacity & extensive QC
- Classifier software for simplification and predictivity
- Delivers insights on mechanism of action

CellCiphr™ Cytotoxicity Panel #1

*Cellumen patents pending

CellCiphr™ Cytotox Panel #1 Features HepG2 Cells

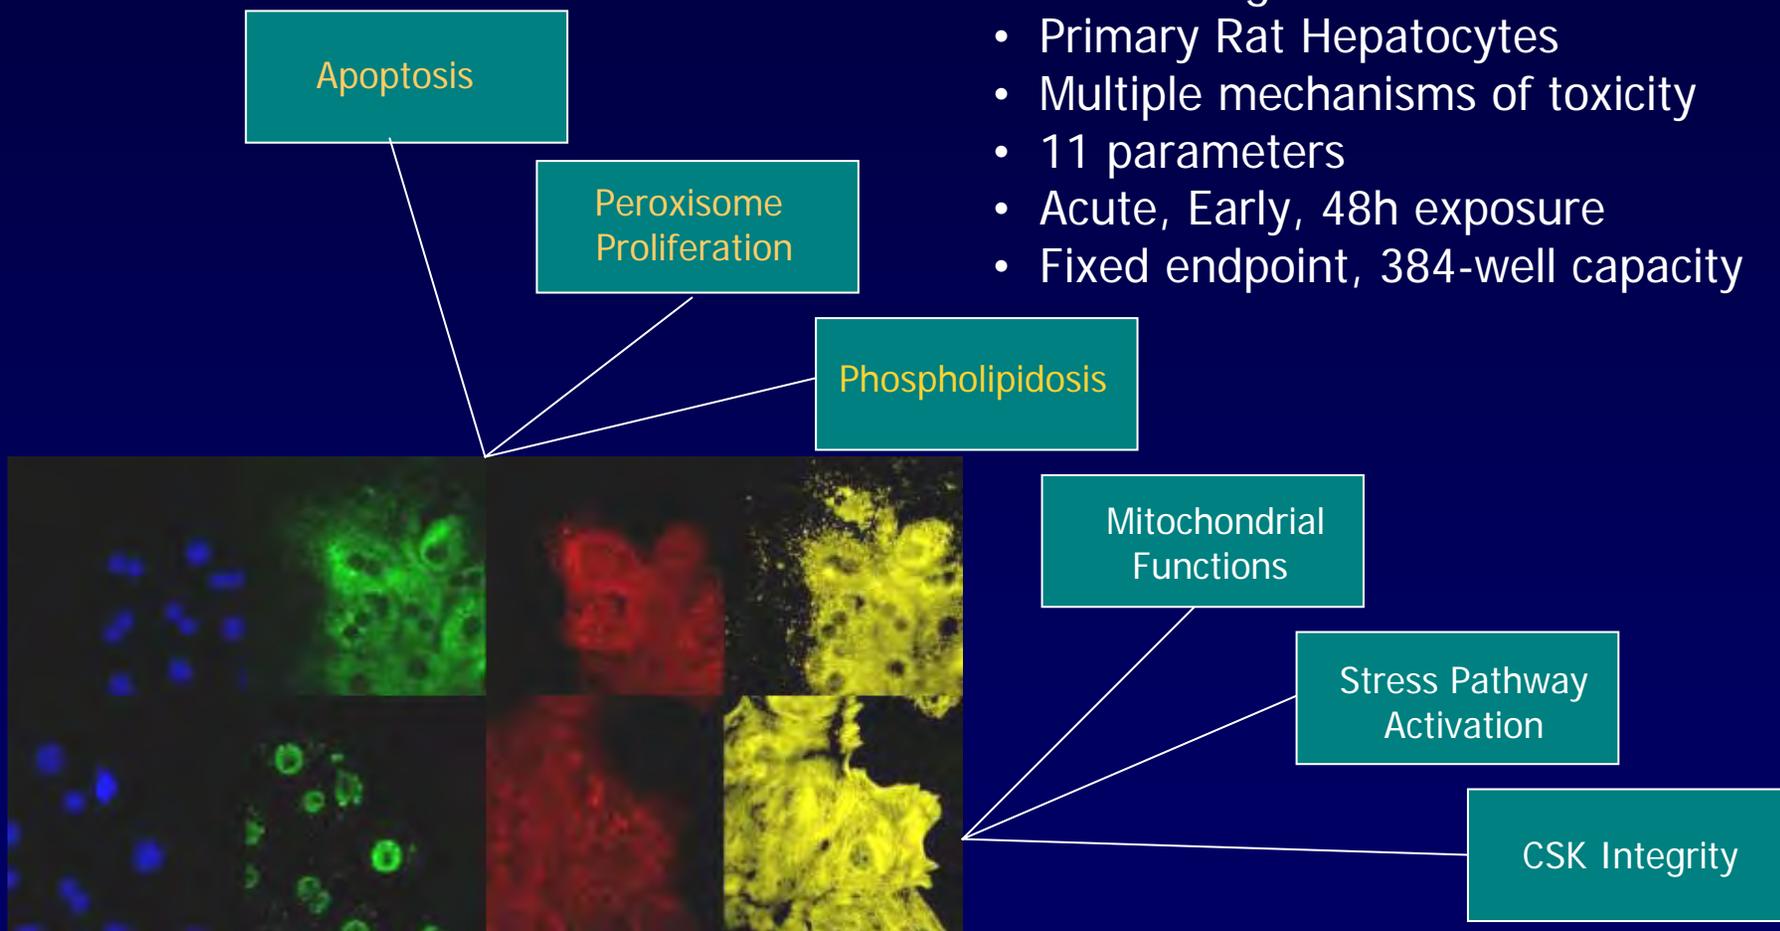

Cell Features	Measurement	Reagents
Cell Loss Cell Cycle Arrest DNA Degradation Nuclear Size	Cell Number DNA Content DNA Structure Nuclear Area	Hoechst 33342
Oxidative Stress	Histone H2A.X Phosphorylation	anti-phospho-histone H2A.X Antibody
Stress Kinase Activation	c-Jun Phosphorylation	anti-phospho-c-jun Antibody
DNA Damage Response	p53 activation	anti-p53 Antibody
Mitochondrial Function I	Mitochondrial memb. potential	MitoTracker Red
Mitochondrial Function II	Mitochondrial mass	MitoTracker Red
Mitosis marker	Histone H3 Phosphorylation	anti-phospho-histone H3 Antibody
Microtubule CSK	Microtubule stability	anti- α -tubulin Antibody

CellCiphr™ Cytotoxicity Panel #2

Panel 2 design*:

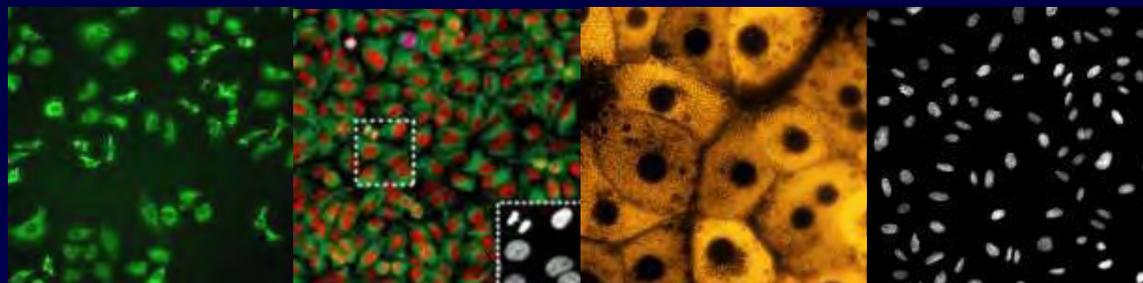

- Primary Rat Hepatocytes
- Multiple mechanisms of toxicity
- 11 parameters
- Acute, Early, 48h exposure
- Fixed endpoint, 384-well capacity

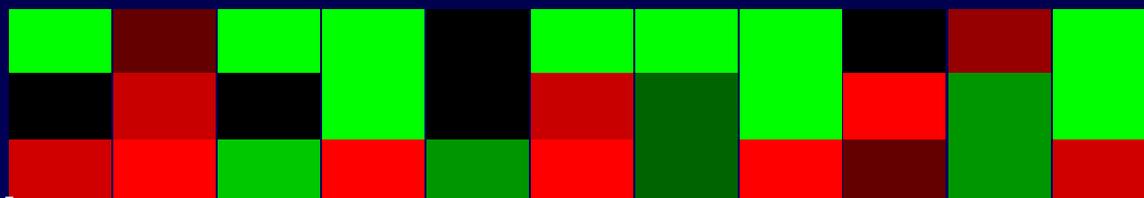

* Cellumen patents pending

Quantitative and Visual Tools for Compound Profiling

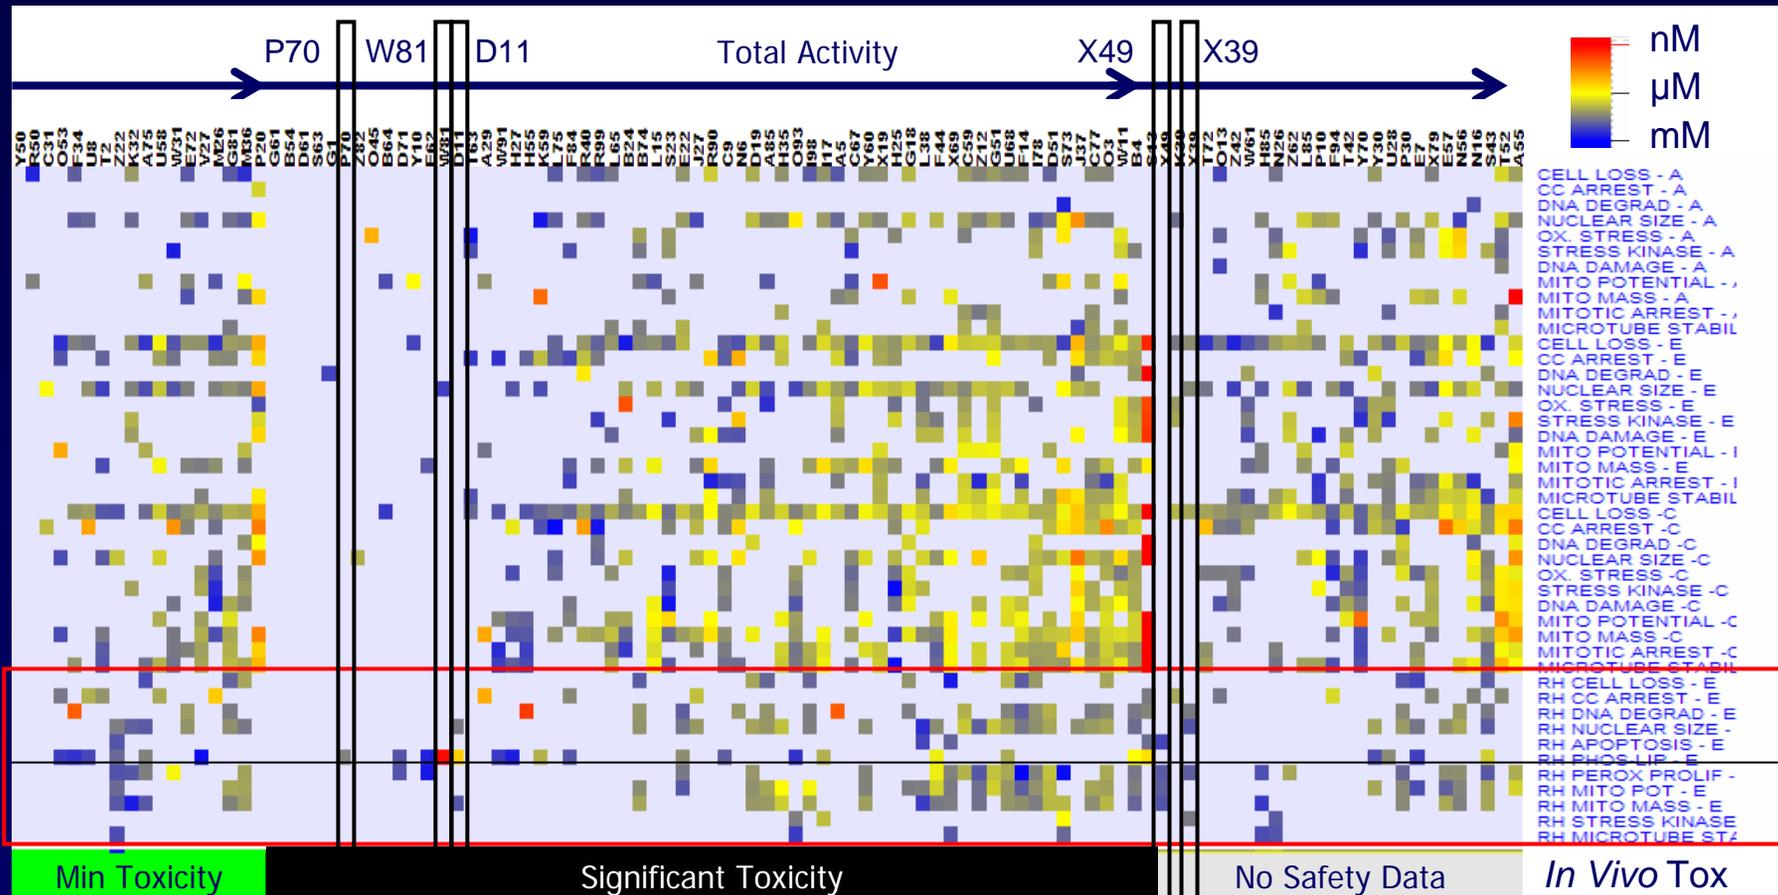

CellCiphr™ Profiling Case Study

- Drug Safety Data for 137 compounds*
- Each compound scored on a scale of 0, 1, 2, 3, 4 for in vivo toxicity
- Compounds tested in CellCiphr HepG2 Panel 1 and CellCiphr Rat Hepatocyte Panel 2
- CellCiphr 1 automated analysis provided similarity to known controls, the group toxicity rank order and a safety index

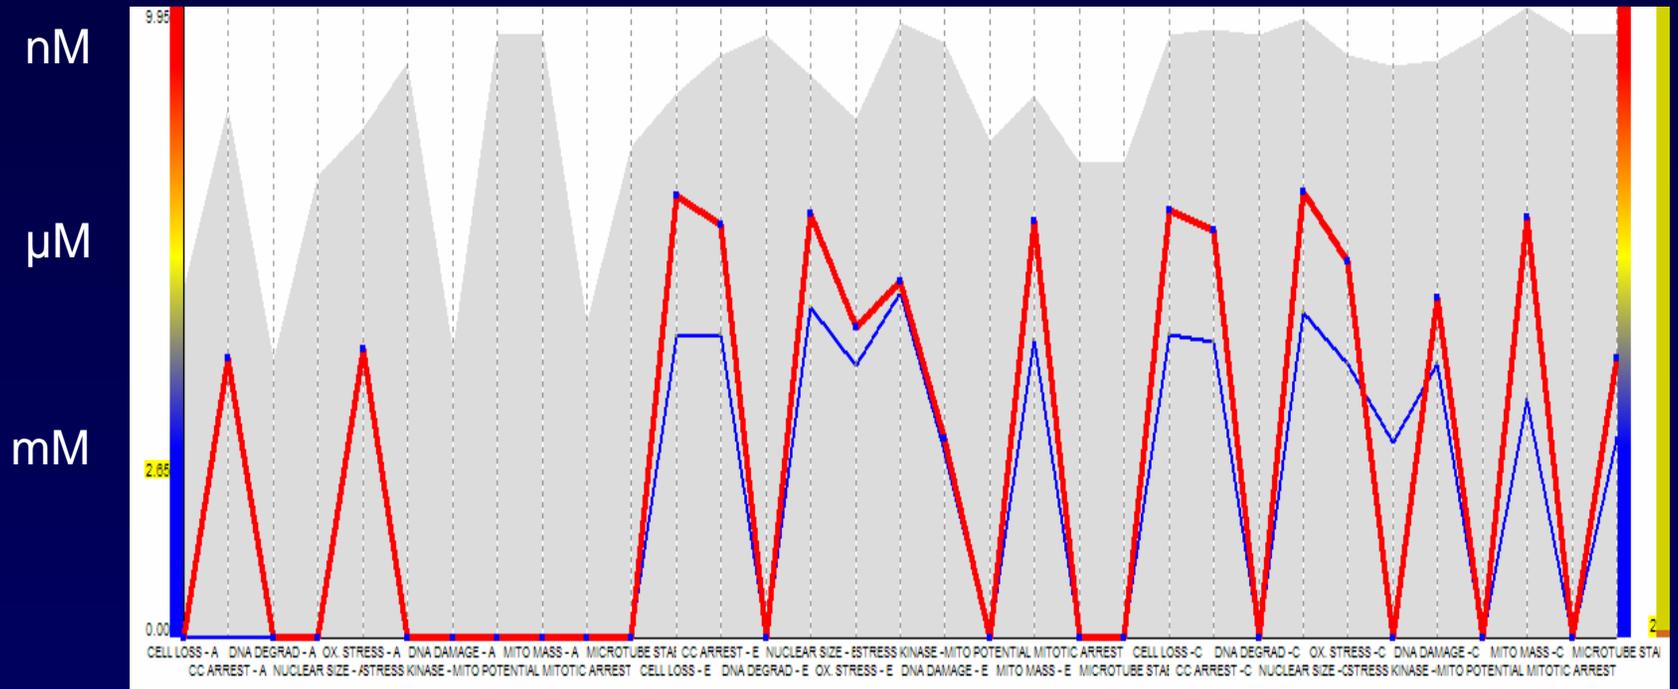

* Includes 101 unknown (blinded) and 36 control compounds

Combining CellCiphr™ Features from HepG2 and Rat Hepatocytes Optimizes Toxin Detection

CellCiphr™ Similarity Profile

Compound	Differences from Etoposide (red)
H25 (blue)	- CC Arrest Acute
H25 (blue)	- Stress Kinase Chronic

Classifier Design

- 137 compounds produced over 4500 dose-response curves
- Difficult to apply manual scoring methodology to handle analysis
- Assay data from compounds was used with in vivo scorings to construct a classifier to rank compound toxicity
- First generation classifier had improved performance over simple cytotoxicity assay

Accuracy of CellCiphr Classifier 1

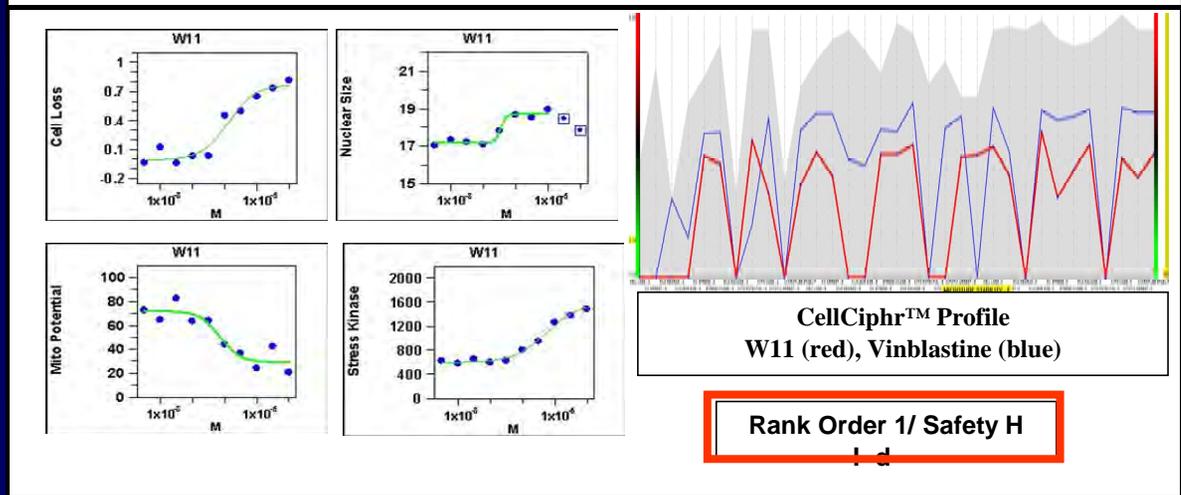

<i>In vivo</i> Toxicity	n	24 hr cell loss	CellCiphr Classifier
Significant	47	84%	100%
Moderate	66	65%	80%
Minimal	24	25%	46%
Overall accuracy	137	61%	82%

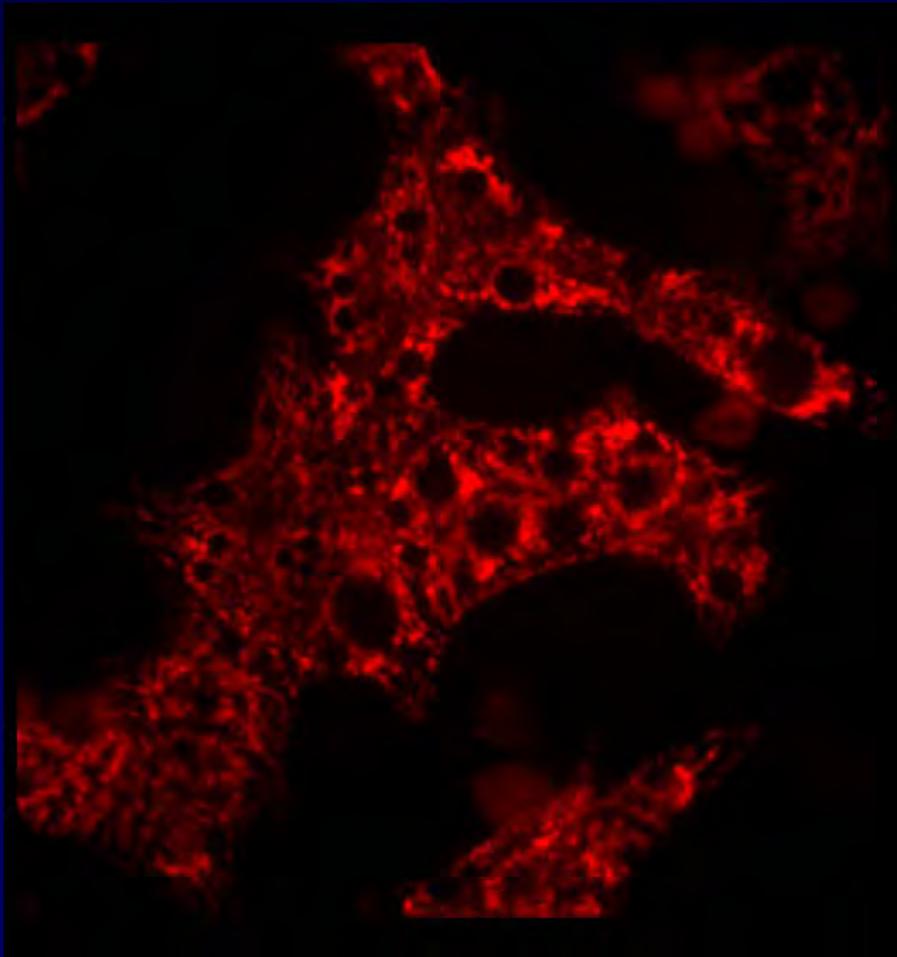

CellCiphr™ Report

Compound: W11			
Source: CHA Project	Measurable Effects	AC ₅₀ (M)	Time (hrs)
Maximum Tolerate Dose		n/a, 1.2E-5	1, 72
Earliest Toxic Indicator	Mitochondrial Potential	7.07E-07	24
Most Sensitive Toxic Indicator	Nuclear Size	3.90E-07	72
General Indicator of Toxicity	Cell Loss	1.5E-6, 1.3E-6	1, 72
	Nuclear Size	8.4E-6, 3.4E-7	1, 72
	Oxidative Stress	1.9E-6, 2.2E-6, 36.8E-6	1, 24, 72
	Stress Kinase	1.9E-6, 3.6E-6, 5.7E-6	1, 24, 72
	DNA Damage	993.0E-9, 982.4E-9	1, 72
Mechanistic Indicators	Mitosis Arrest	2.3E-6, 9.1E-6	1, 72
	Microtubule Stability	2.0E-6, 16.0E-6, 1.9E-6	1, 24, 72
	Cell Cycle Arrest	8.4E-6, 8.0E-6	1, 72
	Mitochondrial Potential	7.07E-7	24
	Mitochondrial Mass	27.2E-6, 2.5E-6	24, 72

Correlation with Other Compounds	Compound	Correlation Coefficient
Similarity with Compounds in set	C9	0.59
	Vinblastine	0.70
	Nocodazole	0.69
Similarity with Toxin Cassette Compounds	Colcemid	0.60

CellCiphr™ Panel 3: Rat Hepatobiliary

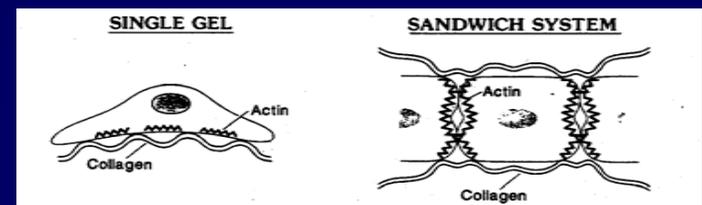

- Highly differentiated rat hepatocytes (sandwich culture)
- Chronic exposure (3 day +)
- 384 well capacity
- Functional assays for:
 - Cholestasis
 - Steatosis
 - Mitochondrial potential

Monolayer culture

overlay culture

CellCiphr™ Panels in Development

Human and Rat 1° and Cell Lines

- Tissue selectivity panels
 - Neuronal cells
 - Cardiomyocytes
- Stem-cell derived cultures
- Co-culture/tissue engineered array models
- Kinetic, Live Cell Panels

Summary

- The CSB approach to cell based discovery is being implemented to improve efficacy and decrease toxicity of leads, clinical candidates & drugs
 - Cellular models of disease
 - Cytotoxicity profiling
 - Patient sample profiling
- CSB based cytotoxicity profiling assays and classifiers are evolving to improve early decision making
