PATITIS PANEL						
	HEPATITIS A AB, TOTAL	NON-REACTIVE			NON-REACTIVE	[redacted]
	THIS TEST DETECTS TOTAL ANTIBODIES TO HEPATITIS A, AND DOES NOT DIFFERENTIATE BETWEEN IGG AND IGM.					
	HEPATITIS B SURFACE ANTIBODY QL	NON-REACTIVE			NON-REACTIVE	[redacted]
	HEPATITIS B SURFACE ANTIGEN	NONE DETECTED			NONE DETECTED	[redacted]
	HEPATITIS B CORE AB TOTAL	NON-REACTIVE			NON-REACTIVE	[redacted]
	HEPATITIS C ANTIBODY	NON-REACTIVE			NON-REACTIVE	[redacted]
	A REPEATEDLY REACTIVE RESULT INDICATES PAST OR PRESENT HEPATITIS C VIRUS (HCV) INFECTION OR POSSIBLY A CARRIER STATE, BUT DOES NOT SUBSTANTIATE INFECTIVITY OR IMMUNITY. HOWEVER, A PATIENT WITH A REPEATEDLY REACTIVE RESULT SHOULD BE CONSIDERED INFECTIOUS.					
	WITH THE HCV ANTIBODY TEST, FALSE POSITIVE RESULTS CAN OCCUR. THE ABSENCE OF ANTIBODIES TO HEPATITIS C VIRUS DOES NOT RULE OUT INFECTION WITH HCV. THEREFORE, WHEN THE DIAGNOSIS OF NANBH IS STRONGLY SUSPECTED, SEQUENTIAL REPEAT TESTING FOR ANTI-HCV IS RECOMMENDED.

PA AND LATERAL CHEST: 7-22-98.

HISTORY: None given. Compared to previous exam 7-20-98.

There is mild peribronchial thickening consistent with bronchitis. On lateral view there is increased density within the anterior aspect of the lower lobe. This is not well visualized on PA view making it difficult to ascertain if this is a right or a left lower lobe infiltrate. Pulmonary vascularity and cardiac size are normal.

IMPRESSION:

1. Peribronchial thickening.
2. Lower lobe infiltrate.

CT OF THE ABDOMEN AND PELVIS: 7-22-98.

HISTORY: R/O renal/liver masses. No previous exams.

There is a 1.5cm focal area of low attenuation within the anterior aspect of the junction of the right and left lobes of the liver. This partially enhances however does not become completely isodense. Possibility of small hemangioma is considered. Recommend correlation with ultrasound or follow up CT in 3 months to evaluate stability. A solitary gallstone is noted. No dilated intrahepatic ducts. Small right pleural effusion. Pancreas, spleen, kidneys and aorta appear normal.

Small amount of pelvic fluid. Both ovaries appear slightly prominent.

IMPRESSION:

1. Focal low attenuation region within liver which partially enhances. See above comments.
2. Small right pleural effusion.
3. Cholelithiasis.
4. Small amount of pelvic fluid with prominent ovaries.

	STAT		PREOP	O_2 GOING		IV GOING	

MAMMOGRAPHY OF RIGHT BREAST: requested for a right breast lesion. 7-23-98. Due to patient's age of 31 years examination was begun with right breast ultrasound.

The visible area slightly lateral to the right nipple at 9 o'clock position was imaged with ultrasound and reveals multiple irregular partially sonolucent tubular areas with marked posterior acoustical shadowing. Possibility of inflammatory or neoplastic process is considered. Due to the bizarre ultrasound findings mammography was obtained with left breast also for comparison. The area of visible abnormality within the right breast was marked with radiopaque marker within the lateral right retroareolar region. No dominant mass or malignant appearing microcalcifications are noted within this area. Approximately 12cm posterior to the areolar on the right CC view is a somewhat oval slightly irregular marginated 2 by 1.8cm ~~cyst~~ like density. Ultrasound of this area was performed and reveals a 2.62 by 1.20cm oval solid mass with irregular margins and a smaller solid mass at the 12 o'clock position measuring 1.07 by 0.96cm. Due to the disorganized pattern on ultrasound and posterior acoustical shadowing of the area of visible lesion just lateral to the right nipple would recommend aspiration for further evaluation. The 2 solid masses within the right breast could be further evaluated with needle aspiration. If needle aspiration is not performed recommend short term follow up exam of 2 solid lesions within the right breast.

No abnormalities left breast are noted.

IMPRESSION:
1. Disorganized ultrasonic pattern to the right of the nipple at approximately 9 o'clock position within the right breast possibly representing inflammatory process however malignancy cannot be excluded. See above comments.
2. 2 solid nodules within right breast.

Vital information is present on every mammogram. When mammograms are checked out, PLEASE RETURN THEM FOR FURTHER REFERENCE. (A) A negative mammogram report should not delay biopsy if a dominant or clinically suspicious mass is present. 4-8% of cancers are not identified by mammograms. (B) A negative report may reinforce clinical impression. Adenosis and dense breasts may obscure an underlying neoplasm. (C) False positive report average 6-10%.
