ENVIRONMENTAL ASSESSMENT REPORT

This Environmental Assessment is submitted in compliance with 21 CFR 25.31a to support the supplement to New Animal Drug Application (NADA) #11-315 for Neomix® 325/Neomix® Ag 325 (neomycin sulfate) Soluble Powder.

1. DATE

February 29, 1996
[revision of September 1991 EA (see Section 14)]

2. NAME OF APPLICANT

The Upjohn Company

3. ADDRESS

The mailing address and corporate telephone of The Upjohn Company's headquarters is:

7000 Portage Road
Kalamazoo, MI 49001

Corporate telephone (616) 323-4000

4. DESCRIPTION OF THE PROPOSED ACTION

4.1 Requested Approval - Need for the Action

This environmental assessment is necessary for approval of the supplemental New Animal Drug Application (NADA) #11-315 for neomycin sulfate [U-4567; Neomix® 325 Soluble Powder (commercial grade) or Neomix® Ag 325 Soluble Powder (agricultural grade)], hereinafter referred to as Neomix. Neomix will be used in growing turkeys for the therapeutic treatment and control of colibacillosis (bacterial enteritis) caused by *Escherichia coli*. Maximum dosage will be 7.0 mg of neomycin base (10 mg neomycin sulfate) per pound of body weight per day. Neomycin sulfate will be supplied to the turkeys in the drinking water for up to five days.

Neomycin sulfate is also approved for use in cattle (excluding veal calves), swine, sheep and goats for the treatment and control of colibacillosis (bacterial enteritis) caused by *Escherichia coli* susceptible to neomycin. It has been used by veterinarians and farmers for over 35 years to treat livestock suffering from bacterial infections susceptible to its antibacterial action. Neomycin enters the environment primarily in animal feces in the rural areas of the United States.

Neomix 325®/Neomix® AG 325 (Neomycin Sulfate) Soluble Powder
NADA #11-315
Environmental Assessment Report

4.2 Location Where the Product Will be Produced

The drug substance and drug product will be produced at The Upjohn Company's main chemical and pharmaceutical manufacturing complex at 7171 Portage Road, Kalamazoo, Michigan.

4.3 Locations Where the Product Will be Used

The finished drug product will be stored in distribution centers prior to transportation for sale to veterinary clinics and animal health product outlets. The drug product will be used on turkey producers' farms throughout the United States.

4.4 Locations Where the Product Will be Disposed

Disposal of drug substance or drug product may result from processing in the form of off-specification lots, from distribution activities in the form of returned goods, or from end-user disposal of individual units of empty or partly empty finished product containers. Bulk quantities of material for disposal will be generated only at the manufacturing site and will be handled with other compatible waste materials generated as a result of current manufacturing operations. The present infrastructure at the proposed manufacturing site provides for recovery and/or ultimate disposal mechanisms identified below.

Returned goods are received at the Upjohn Portage site where they are incinerated in an on-site approved incinerator. The incinerator is being operated as a RCRA (Resource Conservation and Recovery Act) interim status treatment storage and disposal facility under #MID000820381 in compliance with 40 CFR 264, Subpart O requirements. A hazardous waste RCRA Part B/Act 451, Part 111 permit application has been submitted to the Waste Management Division of the Michigan Department of Natural Resources (now the Michigan Department of Environmental Quality, MDEQ) in Lansing, Michigan. The Upjohn facility is operating under interim status provisions until action is taken on the permit application. MDEQ action on the permit application is expected in 1996. The State air permit issued on July 15, 1980 (#242-80), revised to incorporate the Act 451, Part 111 requirements, was approved on May 26, 1993.

Ash generated as a result of the incineration process will be sent to a permitted hazardous waste landfill. At the present time, Upjohn uses the following facilities for disposal of ash:

- Chemical Waste Management of Indiana, Inc., 4636 Adams Center Road, Fort Wayne, IN, operating license listed under Indiana Dept. of Environmental Management (IDEM) Permit No. IND 078911146;

Neomix 325®/Neomix® AG 325 (Neomycin Sulfate) Soluble Powder
NADA #11-315
Environmental Assessment Report

- Environmental Quality Co., 1349 South Huron Street, Ypsilanti, MI;
Michigan Disposal, Inc., 49350 North I-94 Service Drive, Belleville, MI
(treatment) operating license listed under EPA ID No. MID 000 724 831;
- Wayne Disposal, Inc., 49350 North I-94 Service Drive, Belleville, MI
(disposal) operating license listed under EPA ID No. MID 048 090 633;
and
- Upjohn may use other facilities for such disposal which are suitable for
that purpose and are properly permitted.

Upjohn has contracts with each of the above facilities that require the facility to be in compliance with all applicable laws and regulations. The waste stream profile support documentation established with the hazardous waste landfill sites affirm compliance status. All facilities are audited and approved for use by an Upjohn environmental auditor prior to the first shipment of waste from Upjohn to the site. In addition, Upjohn personnel conduct periodic environmental audits of off-site disposal facilities during use of the facilities.

4.4.3 Discarded Product - Farm Setting

Any discarded product or product containers generated in a farm setting would ordinarily be disposed of in accordance with applicable Federal, State and local regulations. Only minute traces of the active ingredient, neomycin sulfate, would be expected to remain with empty product containers.

4.5 **Type of Environment Present at and Adjacent to Manufacturing Locations**

The drug substance will be manufactured at The Upjohn Company's Portage site facility, located in the northern portion of the City of Portage in Kalamazoo County, Michigan. Kalamazoo County is in the southwest corner of the State approximately 140 miles equidistant from Chicago and Detroit. The facility is approximately 1.7 miles northeast of the center of the City of Portage, approximately 5.4 miles south of the center of the City of Kalamazoo, and directly to the south of the Kalamazoo/Battle Creek International Airport.

The area in the immediate vicinity of the Upjohn facility is a mix of zoning including heavy and light industry, general business, and single- and multiple-family residences. Upjohn is on land zoned for heavy industry. The site is directly bordered by airport property, residences, and undeveloped land. The climate is temperate. In terms of the Universal Transverse Mercator Coordinate System (UTM), the plant is

Neomix 325®/Neomix® AG 325 (Neomycin Sulfate) Soluble Powder
NADA #11-315
Environmental Assessment Report

located in Zone 16 at 619.1 Km east and 4674.1 Km north, which corresponds to latitude 42°12'42" north and longitude 85°33'25" west.

The Portage site complex consists of approximately 80 buildings including chemical and pharmaceutical manufacturing operations, offices, laboratories, utility operations, and various other support buildings (see Appendices 1 and 2). The plant site occupies a portion of approximately 810 hectares lying south of Bishop Road, east of Portage Road, north of Centre Street, and west of Sprinkle Road in Portage, Michigan.

5. IDENTIFICATION OF CHEMICAL SUBSTANCES THAT ARE THE SUBJECT OF THE PROPOSED ACTION

For additional information for Section 5, please refer to the previously approved Animal Health Institute and Upjohn EAs provided in Section 14. The MSDS for neomycin sulfate is included as an appendix (see Section 15).

6. INTRODUCTION OF SUBSTANCES INTO THE ENVIRONMENT - CONTROL SYSTEMS

Portions of the materials listed in Section 5 will be released into the environment from the drug manufacturing site in the form of air emissions, liquid waste streams, and soil wastes.

6.1 Fermentation/Isolation/Purification

6.1.1 Air/Solvent Emissions

The Upjohn Company is operating under a consent judgment with the Michigan Department of Environmental Quality (MDEQ) dated March 15, 1991, which has required that an inventory be taken by December 1991 of all equipment with either the potential to emit an air contaminant or used as a control device and that approved permits be in place for this equipment in accordance with the schedule set forth in the consent judgment. That inventory was submitted to MDNR on July 1, 1991. Where applicable, lowest achievable emission rate (LAER) controls were required to be installed on the volatile organic compound (VOC) portion of the process by August 1, 1996. The neomycin sulfate fermentation and isolation are conducted in Region VI of the air consent judgment covering the Chemical Division. The permit application for all subject equipment in this Region was submitted on March 1, 1994.

Neomix 325®/Neomix® AG 325 (Neomycin Sulfate) Soluble Powder
NADA #11-315
Environmental Assessment Report

The emissions from the fermentation process consist of off gases from fermented beer. Fermentation emissions consist primarily of a large volume of water-saturated exhaust gas. Particulate matter is controlled through the use of Rotoclone wet scrubbers with efficiencies in excess of 95%.

6.1.2 Aqueous Waste Streams

Aqueous process waste streams resulting from fermentation and isolation will consist of spent fermentation broth and residue waste waters from sanitary use and washing operations which will be discarded to the municipal sewer system for biological treatment at the City of Kalamazoo Water Reclamation Plant.

6.1.2.1 *Industrial Pretreatment Program (IPP)*. In response to Federal and State requirements governing the City of Kalamazoo's Industrial Pretreatment Program (IPP), The Upjohn Company has been issued a discharge permit in the form of an Industrial Control Document (ICD) dated March 25, 1994 through March 31, 1999. In addition, The City of Kalamazoo Sewer Use Ordinance and Sewer Use Regulations Numbers are incorporated by reference, below:

- 1-89 (dated December 5, 1989), providing details on penalties for noncompliance;
- 91-1 (dated April 29, 1991), providing pollutant discharge limits for metals;
- and 94-1 (dated February 9, 1994) providing pollutant discharge limits for petroleum hydrocarbons.

The Upjohn Company's wastewater discharges to the Kalamazoo Water Reclamation Plant are regulated by a discharge permit which is designated an Industrial Control Document (ICD). Wastewater discharges from the production of Neomix are permitted and will not impact compliance with the ICD discharge conditions.

6.1.3 Waste Solvents

There are no waste solvents generated in this process.

6.1.4 Solid Wastes

Powdered carbon, Celite Filter Aid, and filter cartridges are disposed of in a permitted non-hazardous landfill. If the company were to dispose of such material at the present time, it will use:

Neomix 325®/Neomix® AG 325 (Neomycin Sulfate) Soluble Powder
NADA #11-315
Environmental Assessment Report

- Westside Landfill in Three Rivers, MI (Waste Management of Michigan, Inc.) operating under State of Michigan Solid Waste Disposal License No. 8147 for bulk, uncrushed material;
- Orchard Hills Landfill in Watervliet, MI, operating under State of Michigan Solid Waste Disposal License No. 8113 for any finished drug product; or
- a facility comparable to those identified above.

Upjohn has contracts with each of the above facilities that require the facility to be in compliance with all applicable laws and regulations. The underlying agreements with the non-hazardous landfills affirm compliance status. All facilities must be audited and approved for use by Upjohn environmental auditors prior to the first shipment of waste from Upjohn to the site. In addition, Upjohn personnel conduct periodic environmental audits of off-site disposal facilities during use of the facilities.

6.2 Micronizing

6.2.1 Air/Solvent Emissions

The Upjohn Company is operating under an air consent judgment with the MDEQ, dated March 15, 1991, which required that an inventory be taken of all equipment with the ability to emit or to control by December 15, 1991 and that complete permit applications be submitted to the MDNR by July 1, 1993. The air use permit application was approved on October 10, 1994, and equipment and materials used in the micronizing process are operating under air use permit #207-93.

Particulate emissions from the production of this product are controlled by a Roto-clone wet scrubber with an efficiency of 75% for this material. A 0.064% material loss to external vent control system is assumed in this process. This assumption is directly related to production capacity and to the process air volumetric flow rate from the specific production module.

The air consent judgment also required that LAER controls be installed on all consent judgment VOC emitting processes by July 1, 1995. VOC emissions result from periodic cleaning of the micronizing equipment using alcohol solution. The spent alcohol solution is sent to the on-site incinerator for proper disposal. Emissions of the alcohol solution during cleaning are very low; therefore, a

Neomix 325®/Neomix® AG 325 (Neomycin Sulfate) Soluble Powder
NADA #11-315
Environmental Assessment Report

separate emission control system is not used for control of VOC emissions. A monthly log is kept of alcohol usage.

6.2.1.1 *Potent Drug*. Neomycin sulfate may also be micronized in the Potent Drug facility as production schedule and room availability dictate. The Potent Drug area has been permitted under Permit to Install No. 105-93 which was approved by the MDNR as part of the consent judgment on September 27, 1993. An application for a Permit to Operate was submitted to the MDNR on November 1, 1993. Activity under a Permit to Operate to the DNR is allowed to continue pending a denial, and no denial has been received. Particulate losses from this area are directed to HEPA filters with a 99.97% removal efficiency.

VOC emissions would occur in the same manner as is in the micronizing area from the cleaning with SD alcohol.

6.2.2 Aqueous Waste Streams

Aqueous waste streams are generated from two different locations in the micronizing process. The first is the water used for scrubbing particulate in the Roto-clone exhaust systems, and this stream is discarded to the municipal sewer system for treatment at the City of Kalamazoo Water Reclamation Plant. The second stream is water used for cleaning the equipment, and this stream is also discarded to the municipal sewer system (see Section 6.1.2.1 for information on the City of Kalamazoo's Industrial Pretreatment Program (IPP)).

6.2.3 Solid Waste

Solid waste from the Micronizing Unit is disposed of as follows:

- soiled plastic bags and Tyvek® protective garments are sent to Upjohn's approved on-site incinerator (see Section 4.4.1);
- used filter media from exhaust systems are sent to Upjohn's on-site incinerator or sent off-site to an approved non-hazardous landfill for special burial (i.e., disposal witnessed by Upjohn personnel for both security and to eliminate dust from worker exposure).

Neomix 325®/Neomix® AG 325 (Neomycin Sulfate) Soluble Powder
NADA #11-315
Environmental Assessment Report

6.3 Drying and Blending

6.3.1 Air Emissions

An air use permit application for this product and its associated equipment as processed in Region II of the air consent decree covering the Pharmaceutical Division was approved by the MDNR on June 17, 1993 and has been identified as Permit to Install No. 730-92. An application for a Permit to Operate was submitted to the MDNR on August 10, 1993.

This air permit covers the drying of neomycin sulfate in either a vacuum drum dryer or a spray dryer, and in any blending operations. A 0.01% loss of neomycin sulfate was assumed from the drum dryer vacuum pump to the atmosphere, a 4% loss from the spray dryer, and 1% loss from the blending operation. Losses from the spray dryer are exhausted through a Roto-clone wet scrubber with an 85% removal efficiency, and the losses from the blending operation are controlled by a Roto-clone wet scrubber with a 92.2% removal efficiency.

6.3.2 Waste Solvents

There are no waste solvents generated in this process.

6.3.3 Solid Wastes

Solid waste (salvage) that is generated from either drying or blending operations will consist mainly of cardboard, paper, and plastics which will be temporarily stored in containers presently located at the proposed facilities and will be either sent to the on-site incinerator or to a permitted off-site nonhazardous landfill.

6.4 Formulation and Packaging - Pharmaceutical Manufacture

6.4.1 Air Emissions

Neomycin sulfate is mixed with excipient ingredients in the Dry Products Mixing, Granulating, and Lubricating area, which is permitted under MDEQ Air Use Permit #202-93, the most recent modification to which was approved on December 14, 1994. Particulate losses from the mixing operation are controlled by a Roto-clone wet scrubber with a 92.2% removal efficiency. An application for a Permit to Operate was submitted on September 27, 1994.

Neomix 325®/Neomix® AG 325 (Neomycin Sulfate) Soluble Powder
NADA #11-315
Environmental Assessment Report

The final formulation is packaged into pouches or fiber drums in the Dry Products Packaging area, which is permitted under MDEQ Air Use Permit #1106-92, approved on March 24, 1995. Particulate losses from the packaging operation are controlled by a Roto-clone wet scrubber with a 92.2% removal efficiency. An application for a Permit to Operate was submitted on September 27, 1994.

6.4.2 Waste Solvents

There are no waste solvents generated in the mixing or packaging steps of the process.

6.4.3 Solid Wastes

Solid waste (salvage) that is generated from either mixing and packaging operations will consist mainly of cardboard, paper, and plastics which will be temporarily stored in containers presently located at the facilities and will be either sent to the on-site incinerator or to a permitted off-site nonhazardous landfill.

6.5 **Applicable Regulations and Laws at the Site**

The following regulations or standards are cited as applicable to the proposed action:

1. Federal Food, Drug and Cosmetic Act, PL 75-717, as amended, including subsections 306(a) and (b) [debarment].
2. Clean Air Act PL 91-604, as amended.
3. Clean Water Act PL 95-217, as amended.
4. Safe Drinking Water Act PL 93-523.
5. Resources Conservation and Recovery Act of 1976 PL 94-580, as amended.
6. Occupational Safety and Health Act of 1970, as amended.
7. Hazardous Materials Transportation Act of 1975, as amended.
8. Standards from the American National Standards Institute.
9. National Fire Protection Agency Standards.
 - a. National Electrical Code Standards
 - b. Life Safety Requirements
10. Act #348 of 1965, Michigan Air Pollution Act, as amended.
11. Act #245 of 1929, Michigan Water Resource Commission Act, as amended.
12. Act #399 of 1976, Michigan Safe Drinking Water Act, as amended.
13. Act #136 of 1969, Michigan Liquid Industrial Waste Disposal Act, as amended.
14. Act #315 of 1969, Michigan Mineral Well Act, as amended.

 Environmental Assessment Report

15. Act #641 of 1978, Michigan Solid Waste Management Act.
16. Act #64 of 1979, Michigan Hazardous Waste Management Act, as amended.
17. Act #368 of 1978, Public Health Code.
18. Chapter 28 of the Kalamazoo City Code (Services and Wastewater) as amended by ordinance No. 1190.
19. Michigan Occupational Safety and Health Act of 1970, as amended. (Local regulation applicable to the State of Michigan.)

Permits and other actions covering specific environmental regulations in force at The Upjohn Company's main pharmaceutical and chemical manufacturing complex in Kalamazoo, Michigan, including permit numbers and expiration dates where applicable, are summarized in the table attached (see Section 15).

6.6 Statement of Compliance

6.6.1 Emission Requirements

The Upjohn Company states that it is in compliance with, or on an enforceable schedule to be in compliance with, all emission requirements set forth in permits, consent decrees or administrative orders applicable to the manufacture of Neomix® 325/Neomix® Ag 325 (neomycin sulfate) Soluble Powder at its facilities in Kalamazoo, Michigan, as well as emission requirements set forth in applicable Federal, State, and local statutes and regulations applicable to the manufacture of Neomycin Sulfate Soluble Powder at its facilities in Kalamazoo, Michigan.

6.6.2 OSHA Requirements

The Upjohn Company certifies that it has comprehensive programs and practices in place addressing all applicable OSHA requirements.

6.7 Use and Disposal of Products

Any discarded product or product containers generated in a farm setting would ordinarily be disposed of in accordance with applicable Federal, State and local regulations. Only minute traces of the active ingredient, neomycin sulfate, would be expected to remain with empty product containers at the turkey producers' farms.

6.8 Effect of the Approval of the Proposed Action

Approval of the proposed action will not result in the modification of the Upjohn Kalamazoo site existing facilities.

Neomycin Environmental Assessment

1. Date

October 13, 1987

2. Name of Applicant

Animal Health Institute

3. Address of Applicant

119 Oronoco St.
Box 1417 - D50
Alexandria, VA 22314

4. Description of the Proposed Action

Approves the use of neomycin sulfate for the oral treatment of cattle, calves, swine, dogs, cats, turkeys, chickens, ducks, and mink for bacterial gastroenteritis caused by susceptible organisms and other diseases caused by organisms susceptible to neomycin. Maximum dosage is 7 mg neomycin base per pound of body weight per day for 14 days.

Neomycin sulfate has been used by veterinarians and farmers through the United States for over 30 years to treat livestock suffering from bacterial infections susceptible to its antibacterial action. Neomycin enters the environment primarily in animal feces and primarily in the rural areas of the United States.

5. Identification of Chemical Substances that are the Subject of the Proposed Action.

Neomycin is a complex organic molecule containing only carbon, oxygen, nitrogen, and hydrogen.

Neomycin sulfate is a mixture of the antibiotics, neomycin B and neomycin C as their sulfate salts. The proportion of neomycin B ranges from 70-99%. The empirical formula for both salts is $C_{23}H_{46}N_6O_{13} \cdot 3H_2SO_4$. The CAS registry number for the mixture of sulfate salts is 1405-10-3. The chemical name for neomycin B is 0-2, 6-diamino-2,6-dideoxy- α -D-glucopyranosyl-(1 \rightarrow 4)-0-2, 6-diamino-2,6-dideoxy- β -L-idopyranosyl-(1 \rightarrow 3)- β -D-ribofuranosyl-(1 \rightarrow 5)-2 deoxy-D-streptamine. The chemical name for neomycin C is 0-2,6-diamino-2,6-dideoxy- α -D-glucopyranosyl-(1 \rightarrow 4)-0-(0-2,6-diamino-2,6-dideoxy- α -glucopyranosyl-(1 \rightarrow 3)- β -D-ribofuranosyl-(1 \rightarrow 5)-2 deoxy-D-streptamine. The structure of neomycin B is found in Figure 1.

-2-

Neomycin sulfate is a white to slightly yellow amorphous powder or cryo-desiccated solid. It is odorless or nearly so and is hygroscopic (1). It has no definite melting point or boiling point. The optical rotation for neomycin B sulfate is $[\alpha]_{25}^D = + 83^\circ$ and for neomycin C sulfate, it is $+ 121^\circ$ (2). Neomycin sulfate is very soluble in water, 6300 mg/L and less soluble in other solvents, methanol, 225 mg/L; isoamyl alcohol, 247 mg/L; ethanol, 95 mg/L, and cyclohexane, 80 mg/L (3).

Neomycin B and neomycin C can be determined at μg levels or greater by GLC (4) and HPLC (5). They are most commonly assayed for by microbiological methods (6).

Neomycin sulfate is stable in water, pH 6 buffer and pH 8 buffer at 23° for 24 months. In pH 4 buffer at 23° for 24 months, 12% of the activity was lost. In water, pH 4 buffer,, pH 6 buffer and pH 8 buffer at 45° for 24 months, its activity declined 27%, 94%, 50%, and 80%, respectively (7).

6. Introduction of Substances into the Environment

Orally administered neomycin is very poorly absorbed from the gastrointestinal tract. It is difficult to determine the amount of neomycin in feces. Therefore, alimentary absorption is based on the difference between the amount given and the amount excreted in the urine. The amount excreted in urine from oral administration has been studied in the dog (8), pig (9) and in man (10-11). The results are shown in Table 1. Therefore the worse case would be about 7% of the dose excreted in the urine as microbiologically active material.

Table 1
Amount of Neomycin Dose
Excreted in the Urine

Species	Dose	% Excreted in Urine	Time of Urine Collection	Reference
dog	120 mg/kg	2.6-6.6%	24 hours	8
pig	11 mg/kg	1.1%	3 hours	9
man	33 mg/kg	<1.0%	48 hours	10
man	66 mg/kg	<1.0%	24 hours	11

-3-

Table 2
Amount of Neomycin Dose
Inactivated in Feces

Species	Dose	Dilution of Feces	% Inactivated	Reference
mouse	204 mg/kg	none	99%	13
rat	200 mg/kg	1/4	75%	13
man	200 mg/kg	1/4	90%	14
man	2500 mg/kg	1/4	90%	12

Most of the neomycin (93-99%) will enter the environment in animal feces. However, most of the neomycin in feces appears to be bound to solids and hence cannot exert its microbiological activity (12-14). This is summarized in Table 2. In one report (14), it was concluded that the mechanism was binding to the solids rather than destruction of the neomycin because the supernate activity did not decrease with time. It should be noted that all except one study was done *in vitro* with diluted feces. The single mouse *in vivo* study gave the highest removal of microbiological activity. Note also that the inactivation is dose related. The lower the dose, the more complete the removal of the microbiological activity. Therefore, the feces from animals treated at 7 mg/lb would be expected to have the potential to inactivate most of the neomycin in the feces and most of the activity from the urine which gets mixed with feces. In most cases, 90-99% of the dose will be inactivated.

A worst case estimate of the amount of neomycin to be introduced into the environment can be made as follows. At the present time, the biggest use of neomycin appears to be the treatment of colibacillosis in veal calves. In 1986, 3, 478, 034 veal calves were slaughtered in the United States (33). If we assume a body weight of 150 pounds per calf, each calf would receive 7 mg/lb X 150 pounds or 1.05 g of neomycin free base per calf. If every calf was treated, the amount used would be 1.05 g/calf/d x 3.5 x 10⁶ calves or 3.67 x 10⁶ g/d. If each calf was treated for the maximum time period, the amount used would be 3.67 x 10⁶ g/d x 14 d or 51.4 x 10⁶ g. This can be converted into a concentration by dividing by the amount of wet feces produced by the total number of veal calves over a 14 day period. The calves would be expected to produce 15 lb/calf/day of wet feces. The total excreta produced would be 15 lb/calf/day x 3.5x10⁶ calves x 14 days or 735x10⁶ lb or 334x10⁶ kg of feces. The concentration of neomycin in the feces would be 51.4x10⁶ g of neomycin divided by 334x10⁶ kg of feces or 0.153 g/kg or 153 mg/kg or 0.153 mg/g of feces. The data shown in Table 2 suggest that at least 90% of this material will be bound to feces solids.

7. Fate of Emitted Substances in the Environment

- a. Neomycin sulfate is not volatile at 50°C (15) and therefore is not expected to enter the air.
- b. Neomycin and the salts of neomycin are very soluble in water (3). While the biological degradation products have not been identified, it is logical to expect that they will be amino sugars that will also be water soluble. Neomycin B does degrade slowly in aqueous mild acid conditions to neamine and neobiosamine B(3). This results in a large drop in microbiological activity as only neamine is active and it is 5 to 25 times less active than neomycin (22). Under more vigorous conditions, it is hydrolyzed to neamine, D-ribose and 2,6-diamino-2,6-dideoxy-L-idose(2). It is highly probable that neamine can be hydrolyzed further to 2-deoxystreptamine and 2,6-diamino-2,6-dideoxy-D-glucose. The three sugars should be readily degraded by microorganisms. Streptamine should be degraded only slightly slower. Neomycin will be mainly bound to the solids of feces (12-14) or soils (19-20). Therefore, little will reach the aqueous environment. The small amount that does will be destroyed by hydrolysis and degradation by microorganisms.
- c. Neomycin is a strongly basic compound. It is bound to the soil components: montmorillonite, vermiculite, illite, and kaolinite (19). Its binding ranges from 10 mg/g of soil to 160 mg/g. See Table 3. It is not readily released from the above materials by aqueous buffers (20). The microbiological activity is poorly recovered as shown in Table 4. It can be released from attapulgite, bentonite, and magnesium aluminum silicate by magnesium ions (21). However, this only occurs under conditions in which the number of clay binding sites remains constant and the number of cations can increase as needed. In most places in the environment, the amount of free cations and soil components will be in a relatively steady state and the number of binding sites for neomycin should remain constant.

A worst case estimate of the concentration of neomycin that would result from the use of neomycin in veal calf production can be made. Four states produce 45% of the veal calves, New York, Wisconsin, Pennsylvania and California. These states have 66,000,000 acres of farm land. Probably no more than 0.1% of this land or 66000 acres will be exposed to veal calf feces. The concentration in the first 6 inches of this soil can be estimated. One hundred fifty three (153) mg/kg neomycin concentration in feces x 9×10^3 kg/acre application rate of wet feces divided by 909×10^3 kg of soil/acre for a concentration of 1.5 mg neomycin/kg of soil = 1.5 ppm. It can be seen from Tables 3 and 4, that this amount of material should be totally bound by the clay in soils. Therefore, little neomycin would be expected to enter the aqueous environment. It should remain bound to feces and soil until it is destroyed by hydrolysis or microbiological activity.

-5-

Table 3
Amount of Neomycin
Bound to Soil

Type of Soil or Clay	Amount of Neomycin Bound (mg neomycin/g soil)	Reference
H-montmarillonite	161 mg/g	19
Ca-montmarillonite	160 mg/g	19
Vermiculite	69 mg/g	19
illite	42 mg/g	19
kaolinite	10 mg/g	19

Table 4
Microbiological Activity
of Neomycin in the
Presence of Soil

Type of Soil of Clay	Amount of Neomycin Added/g of soil	% Antibiotic Activity	Reference
Buffer Control	0.8 mg/g	100%	20
Kaolinite	0.8 mg/g	87.5%	20
Montmarillonite	0.8 mg/g	0	20
Illite	0.8 mg/g	0	20

8. Environmental Effects of Released Substances

The mammalian toxicity of oral neomycin is moderate. The major manifestations of toxicity at high doses are nephrotoxicity and ototoxicity (23). The acute toxicity of oral neomycin is low. The summary of this by Umberger (23) shows the following LD₅₀'s at high doses.

Animal Species	Route of Administration	Mean LD ₅₀ mg/kg
Mouse	Oral	14250
Mouse	Oral	>2850
Rat	Oral	>2850

-6-

A lifetime feeding study was done in rats (24). The doses were 0, 6.25, 12.5, and 25 mg/kg/day. Survival rates, growth curves, and body weights of the treated groups did not differ significantly from the controls. There were no significant clinical laboratory or histological parameter differences between the treated and the controls. No significant oncogenic effects were observed. No auditory function differences were observed.

A three-generation reproduction teratology study was run in rats (25). The reproduction portion used doses of 6.25, 12.5, and 25 mg/kg/day. The teratology portion used doses of 62.5, 125, and 250 mg/kg/day. No reproduction or teratology effects were observed.

A one-year tolerance study was run in the adult cat at doses of 0, 6.25, 12.5, and 25 mg/kg/day (26). Most clinical laboratory and histological parameters showed no difference between the treated and controls. The high-dose male cats showed slightly elevated BUN levels but no histological evidence of nephrotoxicity. Qualitative auditory acuity testing during the study showed no changes. Histological examination of the ear showed changes. However, the changes were not dose-related, so no conclusion on ototoxicity could be drawn.

A 30-day study at 400 mg/kg/day orally in adult cats found nephrotoxicity but no ototoxicity (27). This is consistent with the first study results.

A 90-day oral ototoxicity study was run in the guinea pig (28). The doses were 0, 1.0, 5.0, and 10 mg/kg/day. No treatment-related changes in the Preyer pinna reflex threshold or cochlear hair cell counts were observed for any dose. Positive controls receiving 100 mg/kg/day subcutaneously did show the expected changes.

Neomycin has been observed to be toxic to starved daphnia at 25 $\mu\text{g}/\text{ml}$. It also shortened the life span of the daphnia at 12 $\mu\text{g}/\text{ml}$ (29). This test was preliminary and demonstrates the range of toxicity for daphnia. Neomycin has been shown to be toxic to the fly, *Agria affinis*, above 500 $\mu\text{g}/\text{ml}$ (30). It has been administered to fish with no toxic effects noted (31). Because of its binding to soil and feces, concentrations in water are expected to be very low.

Neomycin is biologically active against a broad range of bacteria, but it is inactive against fungi and viruses (22). Some of the sensitivities are shown in Table 5. The lowest sensitivity shown is 0.16 $\mu\text{g}/\text{ml}$. As previously shown, the soil concentration might reach 1.5 $\mu\text{g}/\text{g}$. It is expected that all of this will be bound.

-7-

Table 5
MIC's of Some Microorganism Sensitive to Neomycin
(Reference 22)

<u>Organism</u>	<u>Sensitivity Range</u> <u>µg/ml</u>
B. Subtilis	0.16-0.3
B. Cereus	1-3.33
E. coli	0.3->200
Br. bronchiseptica	3
Pr. vulgaris	1.9-31.2
A. aerogenes	0.4>26
M. flavus	<3
A. cloacae	>30
A. fecalis	0.6-50
Sal. schottmulleri	0.6-16.5

The greatest environmental effect of neomycin would be expected to be against bacteria. However, this antibacterial effect should be destroyed by several mechanisms: destruction in feces, binding to soil, hydrolysis to less active compounds, and degradation by microorganisms. Destruction in feces and binding to soils occurs rapidly and renders neomycin inactive until it can be completely destroyed by the other two mechanisms. There is evidence that this is correct for the related antibiotic, streptomycin (32). Therefore, no environmental effect is expected from released substances from the use of neomycin.

9. Use of Resources and Energy

10. Mitigation Measures

No mitigation measures are required.

11. Alternatives to the Proposed Action

No alternatives have been identified.

Neomix 325®/Neomix® AG 325 (Neomycin Sulfate) Soluble Powder
NADA #11-315
Environmental Assessment Report

REFERENCE 2

Upjohn Approved (March 4, 1992) EA for Neomix

NEOMIX 325 Soluble Powder
NEOMIX AG 325 Soluble Powder

Part 10. Environmental Assessment Report (EA)

This Environmental Assessment Report is submitted in accordance with 21 CFR § 25.31

1. **Date**

23 May 1991

2. **Name of applicant/petitioner**

The Upjohn Company

3. **Address**

The mailing address of The Upjohn Company is 7171 Portage Road, Kalamazoo, Michigan 49001. The telephone number for Upjohn's Headquarters in Kalamazoo is (616 323-4000).

4. **Description of the proposed action**

Approves the use of neomycin sulfate for the oral treatment of cattle (excluding veal calves), swine, sheep and goats for bacterial gastroenteritis caused by susceptible organisms and other diseases caused by organisms susceptible to neomycin. Maximum dosage is 7 mg neomycin base (10 mg neomycin sulfate) per pound of body weight per day for 14 days.

Neomycin sulfate has been used by veterinarians and farmers throughout the United States for over 30 years to treat livestock suffering from bacterial infections susceptible to its antibacterial action. Neomycin enters the environment primarily in animal feces and primarily in the rural areas of the United States.

4.1. **Request approval - Need for the action**

This environmental assessment is necessary for the approval of the new animal drug application (NADA) for NEOMIX® 325 Soluble Powder, NEOMIX® AG 325 Soluble Powder.

4.2. **Location where the product will be produced**

The finished product manufacturing site for NEOMIX 325 Soluble Powder, and NEOMIX AG 325 Soluble Powder is located at The Upjohn Manufacturing Company site located east of Portage Road between Centre Street and Bishop Road in the City of Portage, Michigan. This is the present site of the Company's headquarters and main pharmaceutical manufacturing complex.

**NEOMIX 325 Soluble Powder
NEOMIX AG 325 Soluble Powder**

4.3. Location where the product will be used

Finished products will be stored in distribution centers prior to transportation for sale to veterinary clinics and animal health outlets. The ultimate use of the finished product will be on the livestock producer's farm or feedlots.

4.4. Locations where product will be disposed

Disposal of product may result during manufacturing activities in the form of discarded off-specification lots, from the discarding of return goods; or from end-user disposal of individual units of empty or partly empty finished product vials. Bulk quantities of material for disposal will be generated only at the manufacturing site and will be handled with other compatible waste materials resulting from current operations. The present infrastructure at the proposed manufacturing sites provide for recovery and/or ultimate disposal mechanism.

Individual empty or partly empty end products disposed by consumers will be handled along with household garbage by the community's solid waste management system. Only minute traces of product would be expected to remain with empty product containers.

4.5. Type of environment present at and adjacent to manufacturing locations.

The Portage site complex consists of approximately 80 buildings including chemical/pharmaceutical manufacturing operations, offices, laboratories, utility operations, and various other support building (see Figure 14-1). The plant site occupies a portion of approximately 810 hectares lying south of Bishop Road, east of Portage Road, north of Centre Street, and west of Sprinkle Road in Portage, Michigan. AGA Gas, Inc. is located south of the plant with the remainder of the plant surrounded by farm land and open spaces. The area is relatively flat and rural with the nearest school located approximately three kilometers to the southwest. The area is dominated largely by agriculture, forest land, and undeveloped open spaces. The plant is located, in terms of the Universal Transverse Mercator Coordinate System (UTM), in Zone 16 at 619.1 Km east and 4674.1 Km north, which corresponds to latitude 42° 12'42" north and longitude 85° 33'25" west.

5. Identification of chemical substances that are the subject of the proposed action

The following summary describes the main properties of the ingredients used in the formulation of the drug products:

**NEOMIX 325 Soluble Powder
NEOMIX AG 325 Soluble Powder**

A. Neomycin Sulfate

$C_{23}H_{46}N_6O_{13}SO_4$
M.W. = Variable
CAS # 1405-10-3

Non-flammable amorphous powder soluble in water.

B. Sucrose

$C_{12}H_{22}O_{11}$
M.W. = 342.30
CAS # 57-50-1

Non-flammable white crystals soluble in water.

For additional information for Section 5, please refer to the Animal Health Institute Master File for the EA dated 13 October 1987, which was revised in June 1988 and submitted to the Agency 1 July 1988. The EA was found adequate in a letter from the Agency to AHI dated 3 March 1989.

6. Introduction of substances into the environmental - Control Systems

For additional information for Section 6, please refer to the Animal Health Institute Master File for the EA dated 13 October 1987, which was revised in June 1988 and submitted to the Agency 1 July 1988. The EA was found adequate in a letter from the Agency to AHI dated 3 March 1989.

Portions of the materials listed in Section 5 will be released to the environment from the bulk manufacturing site in the form of air emissions, liquid waste streams and solid wastes.

6.1. Chemical processing

Most of the emissions generated from the chemical process consist of volatile organic compounds that result from bulk material transfer, heating, filtration, distillation and drying operations. However, the use of condensers and closed systems minimize the resulting emissions to appropriate control levels in accordance to local and federal standards as outlined in the EPA's "OAQPS Guideline Series Publication No. 1.2-105, Control of Volatile Organic Emissions from Manufacture of Synthesized Pharmaceutical Products," December 1978. The finished bulk drug intermediate is transferred into fiber drums for transportation to pharmaceutical formulation area.

Adequate protection is provided to employees by preventing unnecessary exposure to emissions from the manufacturing process. All solvent tanks and reactors are equipped with approved safety vent systems.

Aqueous waste streams resulting from the chemical process consist of residual wastewater from sanitary use, process wastewater

**NEOMIX 325 Soluble Powder
NEOMIX AG 325 Soluble Powder**

streams containing trace amounts of various solvents and impurities, and liquid waste streams containing waste solvents.

At the Portage Road plant, the sanitary wastewater is currently discharged to the Kalamazoo Water Reclamation Plant presently performing tertiary treatment. The process wastewater is discharged to the Kalamazoo Water Reclamation Plant and/or on-site deepwell injection facility. The discarded solids are rinsed prior to removal for disposal at a local landfill along with the other solid wastes generated at the plant site. Waste solvents are either sent to an existing solvent recovery area where they are reprocessed for reuse or sent to an off-site approved facility for ultimate disposal. The waste solvent storage area has received interim authorization from the EPA as a hazardous waste facility.

6.2. Pharmaceutical formulation

Air emissions in the form of particulate matter and volatile organic compounds will result from product formulation operations. However, these will be minimal since appropriate controls are provided to reduce emissions to acceptable levels according to local and federal standards. Adequate protection will be provided to employees by preventing unnecessary exposure to resulting uncontrolled emissions.

Liquid waste streams resulting from the pharmaceutical facility consist of residual wastewater from sanitary use and washing operations which will be discarded to the sanitary sewer system for treatment at the local wastewater treatment plant. Adequate capacity for wastewater treatment is available at the proposed location. Current limitations on the pharmaceutical categorical pretreatment standards do not apply to the expected waste stream. Nonetheless, the general pretreatment standards will be met as per contractual agreement with the owners of the treatment facility presently in effect.

Solid wastes consists mainly of cardboard, paper and plastics which will be temporarily stored in containers presently located at the proposed facilities and disposed along with other current solid wastes generated at the site. Ultimate disposal of currently generated solid wastes is disposed in a sanitary landfill.

6.3. Effect of the Approval of the Proposed Action - Statement of Compliance

Approval of the proposed action will not result in any modifications since the NEOMIX 325 Soluble Powder, NOEMIX AG 325 Soluble Powder are presently being produced at The Upjohn Company where the following regulations or standards are cited as applicable to the proposed action:

1. Clean Air Act PL 91-604, as amended.
2. Clean Water Act PL 95-217, as amended.

NEOMIX 325 Soluble Powder
NEOMIX AG 325 Soluble Powder

3. Resources Conservation and Recovery Act of 1976 PL 94-580, as amended.
4. Occupational Safety and Health Act of 1970, as amended.
5. American National Standards Institute Standards.
6. National Fire Protection Agency Standards.
 - a. National Electrical Code Standards.
 - b. Life Safety Requirements.
7. Act #348 of 1965, Michigan Air Pollution Act.
8. Act #245 of 1929, Michigan Water Resource Commission Act.
9. Act #399 of 1976, Michigan Safe Drinking Water Act.
10. Act #136 of 1969, Michigan Liquid Industrial Waste Disposal Act.
11. Act #315 of 1969, Michigan Mineral Well Act.
12. Act #641 of 1978, Michigan Solid Waste Management Act.
13. Act #64 of 1979, Michigan Hazardous Waste Management Act.
14. Act #368 of 1978, Public Health Code.
15. Chapter 28 of the Kalamazoo City Code (Services and Wastewater) as amended by ordinance No. 1190.
16. Michigan Occupational Safety and Health Act of 1970, as amended.

(Local regulation applicable to the State of Michigan.)

6.4. Use and Disposal of products

It is estimated that the maximum yearly market volume of the drug product will be approximately 43,081.5 kilograms of the bulk drug and 553,792 packets and drums of the finished product by the end of the first year of production. The disposal of packaging material and empty containers by users will represent a small increment on consumer's refuse.

7. Fate of emitted substances in the environment

For additional information for Section 7, please refer to the Animal Health Institute Master File for the EA dated 13 October 1987, which was revised in June 1988 and submitted to the Agency 1 July 1988. The EA was found adequate in a letter from the Agency to AHI dated 3 March 1989.

**NEOMIX 325 Soluble Powder
NEOMIX AG 325 Soluble Powder**

8. Environmental effects of released substances

For additional information for Section 8, please refer to the Animal Health Institute Master File for the EA dated 13 October 1987, which was revised in June 1988 and submitted to the Agency 1 July 1988. The EA was found adequate in a letter from the Agency to AHI dated 3 March 1989.

9. Use of resources and energy

The use of natural resources and energy for this product is a very small increment of present total plant usage and can be handled by the existing infrastructure. The resources committed will be the materials listed in Section 5, the utilities used in manufacturing and minor miscellaneous support materials.

10. Mitigation measures

To avoid potential adverse impact associated with proposed action, adherence to all applicable state and federal regulations shall be followed as outlined in Section 6.3.

11. Alternatives to the proposed action

Resources and facilities are being used effectively to produce a quality product with minimal environmental impact. No other alternatives are contemplated.

12. List of preparers

Enclosed is a list of those persons, and corresponding qualifications, that participated in the preparation of this assessment. No government agency was consulted for this specific evaluation other than for routine implementation of ongoing environmental programs conducted at existing facilities.

MATERIAL SAFETY DATA SHEET

UPJOHN

Print Date: January 25, 1996
Revision Date: November 21, 1995
Agent Id#: 9307

1. CHEMICAL PRODUCT AND COMPANY IDENTIFICATION

COMMON NAME: NEOMYCIN SULFATE

SYNONYMS: 1405-10-3 - CAS NUMBER

249522 - EDP NUMBER

U-4,567 - UPJOHN U#

MOLECULAR FORMULA: C₂₃H₄₆N₆O₁₃ · 2.5H₂O · 4S

CHEMICAL FAMILY: Aminoglycoside antibiotic

USE: Antibiotic

MANUFACTURER/SUPPLIER: PHARMACIA & UPJOHN INC

7171 PORTAGE RD

KALAMAZOO, MI 49001-0199

TELEPHONE NUMBERS: (616) 323-5122 - (24 HOURS)

(616) 323-7555 - (8:00 a.m. - 4:30 p.m.)

(616) 385-7358 - (SAMPLE REQUEST/TECHNICAL ASSISTANCE)

2. COMPOSITION/INFORMATION ON INGREDIENTS

INGREDIENT 1

COMMON NAME: Neomycin Sulfate

% BY WEIGHT: 100 %

CAS NUMBER: 1405-10-3

EXPOSURE LIMIT(S):

UPJOHN EXPOSURE LIMIT-TWA: 2 MG/M3

3. HAZARDS IDENTIFICATION

EFFECTS OF OVEREXPOSURE: Inhalation or skin exposure may cause very mild to severe allergic reaction in susceptible individuals. Manifestations of an allergic response may include skin rash, fever, bronchospasm, angioedema (swelling of lips, tongue and face accompanied by asthmatic breathing and hives) and anaphylaxis. Neomycin sulfate, like other aminoglycoside antibiotics, may cause severe renal (kidney) toxicity and neurotoxicity including ototoxicity (hearing loss and diminished balance) when administered parenterally (by injection). Neuromuscular blockade and respiratory paralysis have also occurred in rare cases. Other

Neomix 325®/Neomix® AG 325 (Neomycin Sulfate) Soluble Powder
NADA #11-315
Environmental Assessment Report

manifestations of neurotoxicity may include numbness, skin tingling, muscle twitching and convulsion. It is poorly absorbed from the gastrointestinal tract following oral administration. Oral and topical routes significantly reduce the toxic potential but toxicity may still be encountered from exposure to high doses (g quantities) for long durations.

MEDICAL CONDITIONS AGGRAVATED BY EXPOSURE: Hypersensitivity to neomycin sulfate or the aminoglycoside group of antibiotics. Persons with known sensitivity to other aminoglycosides such as streptomycin or gentamycin may be at increased risk of developing hypersensitivity. Persons with impaired renal function are more susceptible to the nephrotoxic and ototoxic effects from administration of this antibiotic. Persons with impaired hearing function are more susceptible to hearing loss from administration of this antibiotic.

4. FIRST AID MEASURES

EYES: Flush with water for 15 minutes. Hold eyelids open to assure complete contact with water.

SKIN: Wash with soap and water. Remove contaminated clothing.

INHALATION: Remove from exposure.

INGESTION: Contact a physician or poison control center.

NOTES TO PHYSICIAN: Nephrotoxicity and or neurotoxicity (including ototoxicity) following oral or topical absorption of neomycin sulfate have been reported. Neuromuscular blockage and respiratory paralysis have also been reported especially in patients receiving anesthetics, neuromuscular blocking agents or massive transfusions of citrate anti-coagulated blood. Calcium salts may reverse blockage but mechanical respiratory assistance may be necessary.

5. FIRE FIGHTING MEASURES

FLASH POINT: Not applicable.

LOWER EXPLOSION LIMIT (LEL): Not applicable.

UPPER EXPLOSION LIMIT (UEL): Not applicable.

EXTINGUISHING MEDIA: Water, carbon dioxide, or dry chemical.

FIRE-FIGHTING PROCEDURES: Wear self-contained breathing apparatus and full body protective equipment.

UNUSUAL FIRE OR EXPLOSION HAZARDS: As with all finely divided organic powders, it is advisable to eliminate explosion hazards by methods such as grounding mechanical equipment in contact with the material to prevent the buildup of static electricity, inerting the atmosphere or controlling dust levels.

Neomix 325®/Neomix® AG 325 (Neomycin Sulfate) Soluble Powder
NADA #11-315
Environmental Assessment Report

HAZARDOUS COMBUSTION PRODUCTS: Carbon monoxide, sulfur oxides, nitrogen oxides.

6. ACCIDENTAL RELEASE MEASURES

STEPS TO BE TAKEN IN CASE MATERIAL IS RELEASED OR SPILLED: Scoop or vacuum (hepa filtered equipment) spilled material and place in container. Wash spill site with water when material pickup is complete.

7. HANDLING AND STORAGE

PRECAUTIONS FOR HANDLING AND STORING: Do not get in eyes, ears, on skin or on clothing. Avoid breathing dust. Use with adequate ventilation. Avoid exposure to open wounds or abraded skin. Wash thoroughly after handling. Store between 15-30 degrees C.

8. EXPOSURE CONTROLS/PERSONAL PROTECTION

RESPIRATORY PROTECTION: Approved respirator or dust mask.

VENTILATION: Local exhaust.

PROTECTIVE GLOVES: Rubber.

EYE PROTECTION: Safety glasses with side shields.

OTHER PROTECTIVE EQUIPMENT: Protective covering for exposed areas of skin.

9. PHYSICAL AND CHEMICAL PROPERTIES

APPEARANCE/PHYSICAL STATE: Amorphous white powder

ODOR: None

OPTICAL ROTATION: +5 degrees (C=2, water)

SOLUBILITY IN SOLVENTS: Slightly soluble in alcohols. Practically insoluble in acetone, ether and chloroform.

SOLUBILITY IN WATER: Soluble. 6.3 mg/ml at 28 C.

VOLATILITY: Nil

10. STABILITY AND REACTIVITY

STABILITY: Stable.

PHYSICAL CONDITIONS TO AVOID: Heat labile.

INCOMPATIBILITY WITH OTHER MATERIALS: None.

HAZARDOUS DECOMPOSITION PRODUCTS: None.

HAZARDOUS POLYMERIZATION: Will not occur.

Neomix 325®/Neomix® AG 325 (Neomycin Sulfate) Soluble Powder
NADA #11-315
Environmental Assessment Report

11. TOXICOLOGICAL INFORMATION

ACUTE STUDIES:

EYE IRRITATION (RABBIT): Non-irritating.

SKIN IRRITATION (RABBIT): Non-irritating to intact skin but slightly irritating to abraded skin.

SENSITIZATION: Hypersensitivity reactions (primarily skin rashes) have occurred in persons treated with neomycin sulfate.

INTRAVENOUS LD50 (MOUSE): 17.4 - 150 MG/KG

ORAL TOXICITY (RAT): Based on a lifetime feeding study, the no observable effect level (NOEL) was determined to be 25 mg/kg/day.

ORAL LD50 (RAT): > 4,325 MG/KG

OTHER STUDIES:

GENOTOXICITY: Ames Assay: Negative.

TERATOGENICITY: Pregnant rats fed 250 mg/kg/day showed no prenatal, fetotoxic or teratogenic effects. However, since ototoxic effects and passage across placenta is known for other aminoglycosides, the potential for harm exists.

CARCINOGENICITY: Did not cause tumor formation when fed to rats at 25 mg/kg/day in lifetime feeding study.

12. DISPOSAL CONSIDERATIONS

WASTE DISPOSAL METHOD: Dispose of by incineration in accordance with applicable international, national, state, and/or local waste disposal regulations.

13. SHIPPING REGULATIONS

Not regulated for transportation by the United States Department of Transportation (DOT), International Maritime Organization (IMO), or International Air Transport Association (IATA). May be subject to state and/or local transportation requirements.

14. OTHER INFORMATION

REVIEWED BY: Environmental Health Sciences.

DISCLAIMER: The MSDS information is believed to be correct but should only be used as a guide. Pharmacia & Upjohn, Inc. disclaims any express or implied warranty as to the accuracy of the MSDS information and shall not be held liable for any direct, incidental or consequential damages resulting from reliance on the information.

15. LABELING

UPJOHN PRECAUTIONARY LABEL CODE(S): B, K-2

HAZARD: TOXIC. SENSITIZER.

SIGNAL WORD: WARNING!

STATEMENT OF HAZARD/RISK PHRASE: May be harmful if swallowed, inhaled or absorbed through skin. May cause sensitization and/or allergic reactions.

PRECAUTIONARY MEASURES: Do not get in eyes, on skin, on clothing. Avoid breathing dust, vapor, mist or gas. Keep container closed. Use with adequate ventilation. Wash thoroughly after handling.

EEC (EUROPE) HAZARD CLASS: HARMFUL.

EEC (EUROPE) STANDARD RISK PHRASE(S): R 42/43 May cause sensitization by inhalation and skin contact.

EEC (EUROPE) STANDARD SAFETY PHRASE(S): S 36/37/39 Wear suitable protective clothing, gloves and eye/face protection.

EEC (EUROPE) HAZARD SYMBOL: St. Andrew's Cross.
