US Surveillance

Summary of Influenza Surveillance, United States **September 28, 2003 – January 31, 2004***

Influenza activity in the United States began uncommonly early and has been moderately severe. Influenza A viruses have predominated (99.4%) in all 9 surveillance regions during the 2003-04 season. The majority of influenza viruses subtyped were influenza A (H3N2). Influenza B viruses have been isolated in all 9 surveillance regions, but only the South Atlantic and Mountain regions have reported more than 10 influenza B viruses for the season. The percentage of specimens testing positive for influenza peaked at 36.0% during the week ending December 6, 2003. The percentage of outpatient visits for influenza-like illness (ILI) peaked at 7.8% during the week ending December 27, 2003 and pneumonia and influenza mortality peaked at 10.3% during the weeks ending January 10 and January 17.

WHO and NREVSS Collaborating Laboratories

Since September 28, WHO and NREVSS laboratories have tested 87,333 specimens for influenza viruses, of which 22,199 (25.4%) were positive. Of these, 22,067 (99.4%) were influenza A viruses, and 132 (0.6%) were influenza B viruses. Of the 22,067 influenza A viruses, 5,782 (26.2%) have been subtyped; 5,780 (99.9%) were influenza A (H3N2) viruses and two (0.1%) was an influenza A (H1) virus. The percentage of specimens testing positive for influenza first exceeded 10% during the week ending October 25, 2003 (19.1%), peaked at 36.0% during the week ending December 6, and remained above 10% until the week ending January 17, 2004 (8.9%). For the week ending January 31, WHO and NREVSS laboratories reported 1,213 specimens tested for influenza viruses, and 76 (6.3%) were positive.

Pneumonia and Influenza Mortality (122 Cities)

The percentage of deaths attributed to pneumonia and influenza (P&I) peaked at 10.3% during the weeks ending January 10 and 17. Although the percentage of deaths due to pneumonia and influenza has declined in recent weeks, the percentage during the week ending January 31 (9.3%) remains above the national baseline (8.2%).

Sentinel Provider Network

The national percentage of patient visits for ILI first exceeded the national baseline of 2.5% during the week ending November 15, 2003 and remained above the baseline for 9 consecutive weeks before declining to 2.0% during the week ending January 17, 2004. The peak occurred during the week ending December 27, 2003 (7.8%). On a regional level the timing of peak ILI activity ranged from the week ending November 22 in the West South Central region to the week ending December 27 in the New England, Mid Atlantic, East North Central and South Atlantic regions. For the week ending January 31, 2004, the national percentage of patient visits for ILI was 1.9%. This is the third consecutive week below the national baseline of 2.5%.

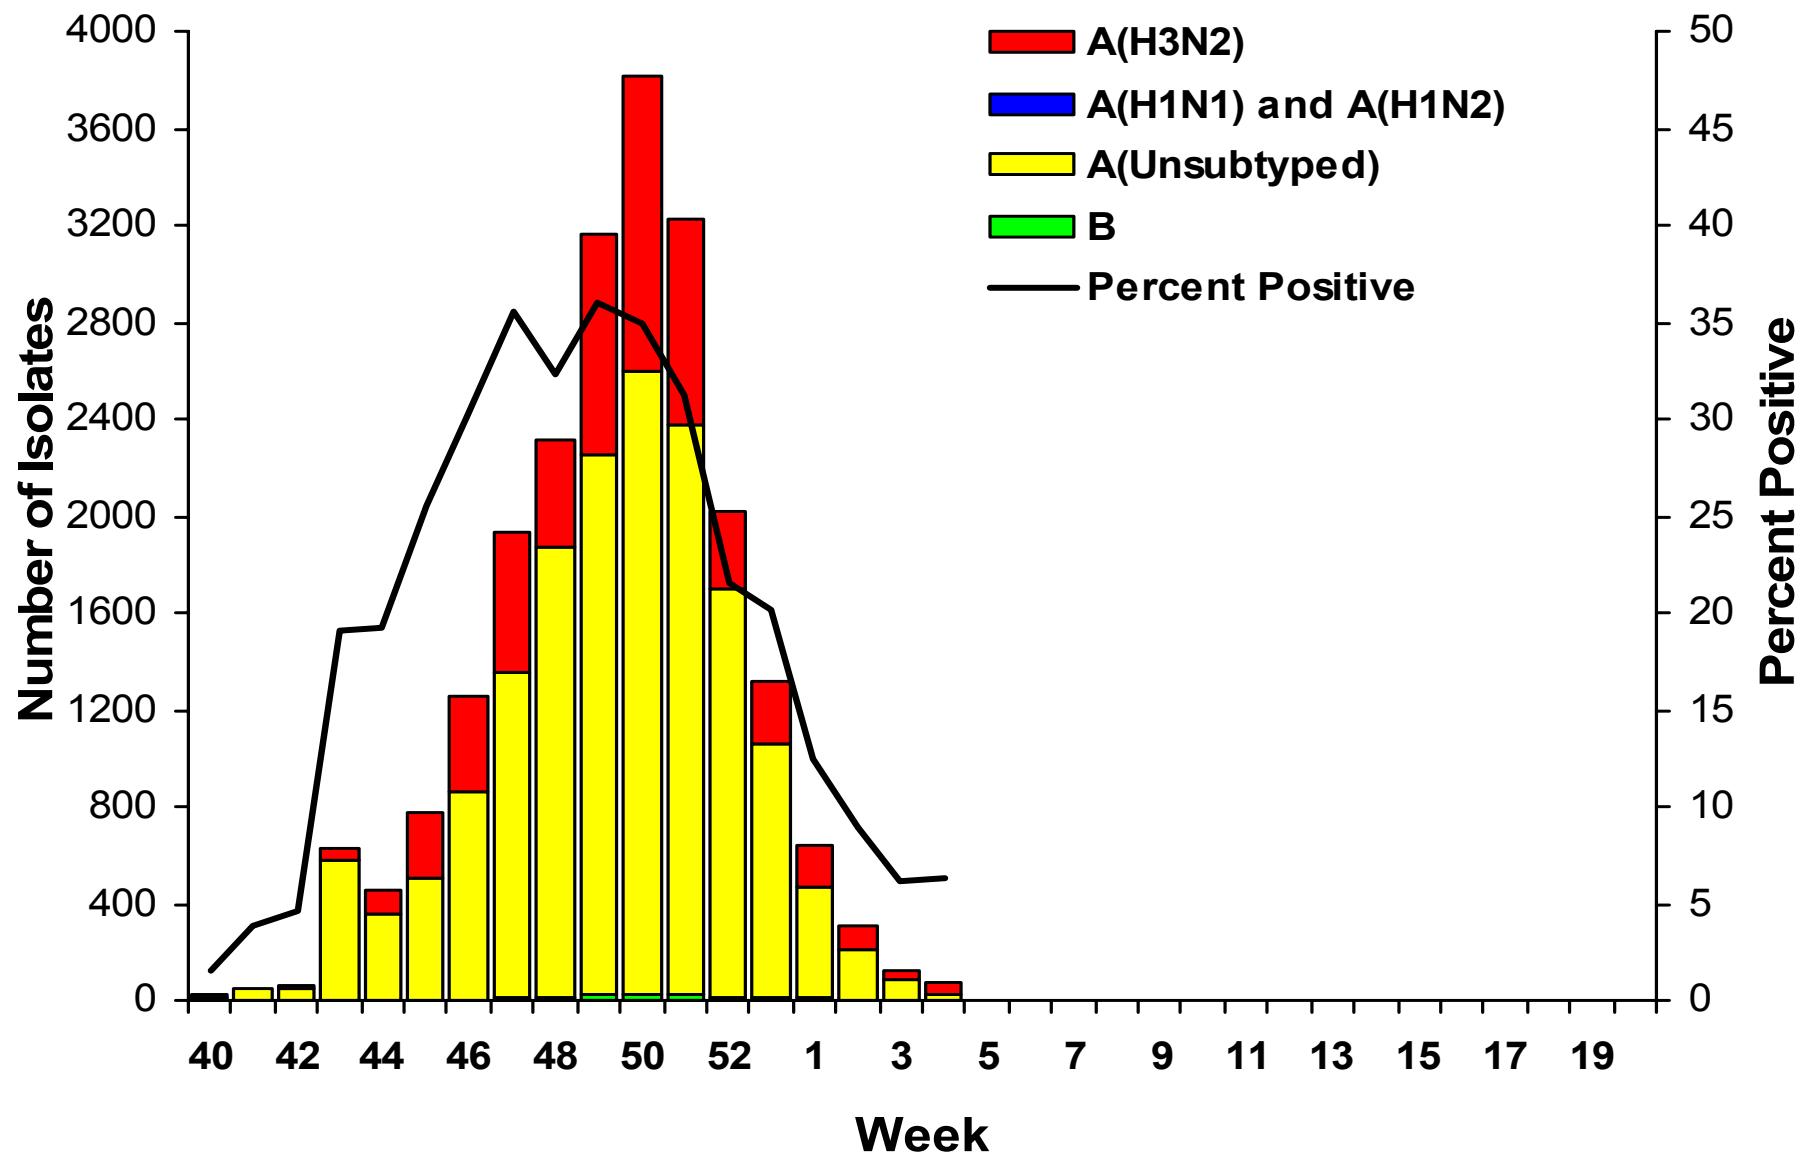

State and Territorial Epidemiologists

Nationally, influenza activity as reported by state and territorial epidemiologists peaked during the week ending December 20 when 45 states reported widespread activity. Widespread activity was first reported by Texas during the week ending October 11, 2003 and remained widespread for 10 consecutive weeks. During the week ending January 31, no states reported widespread activity and 11 states reporting regional activity.

Report prepared: January 31, 2004

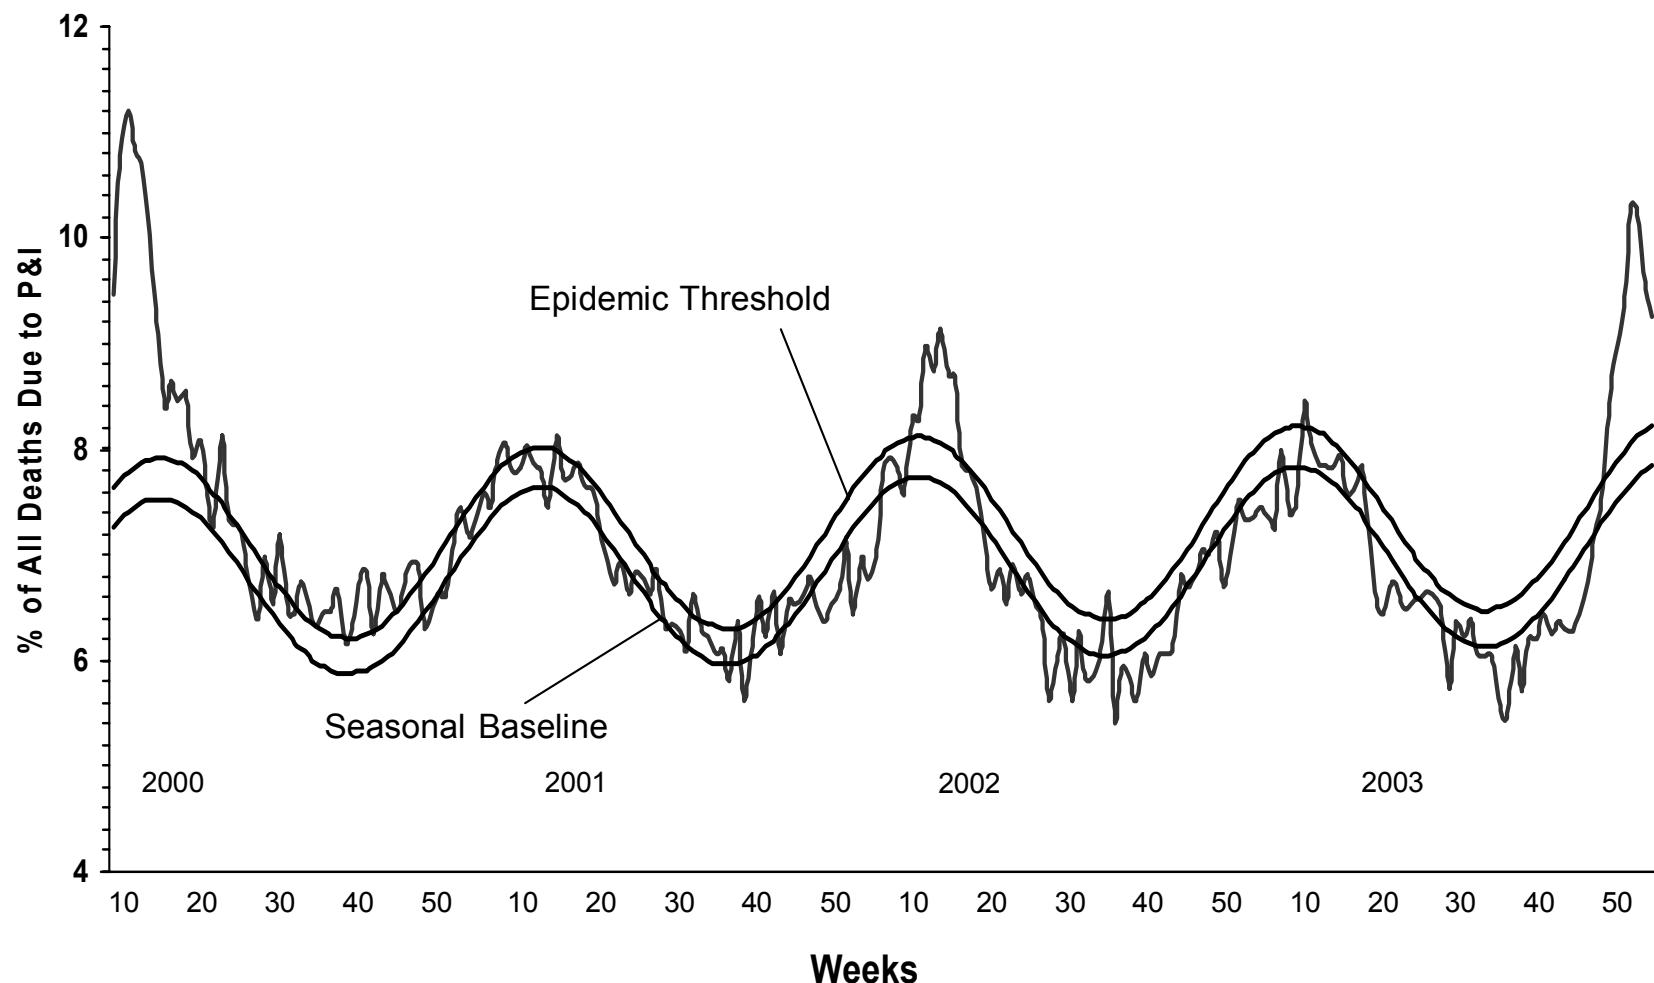

WHO/NREVSS Collaborating Laboratories

National Summary, 2003-04

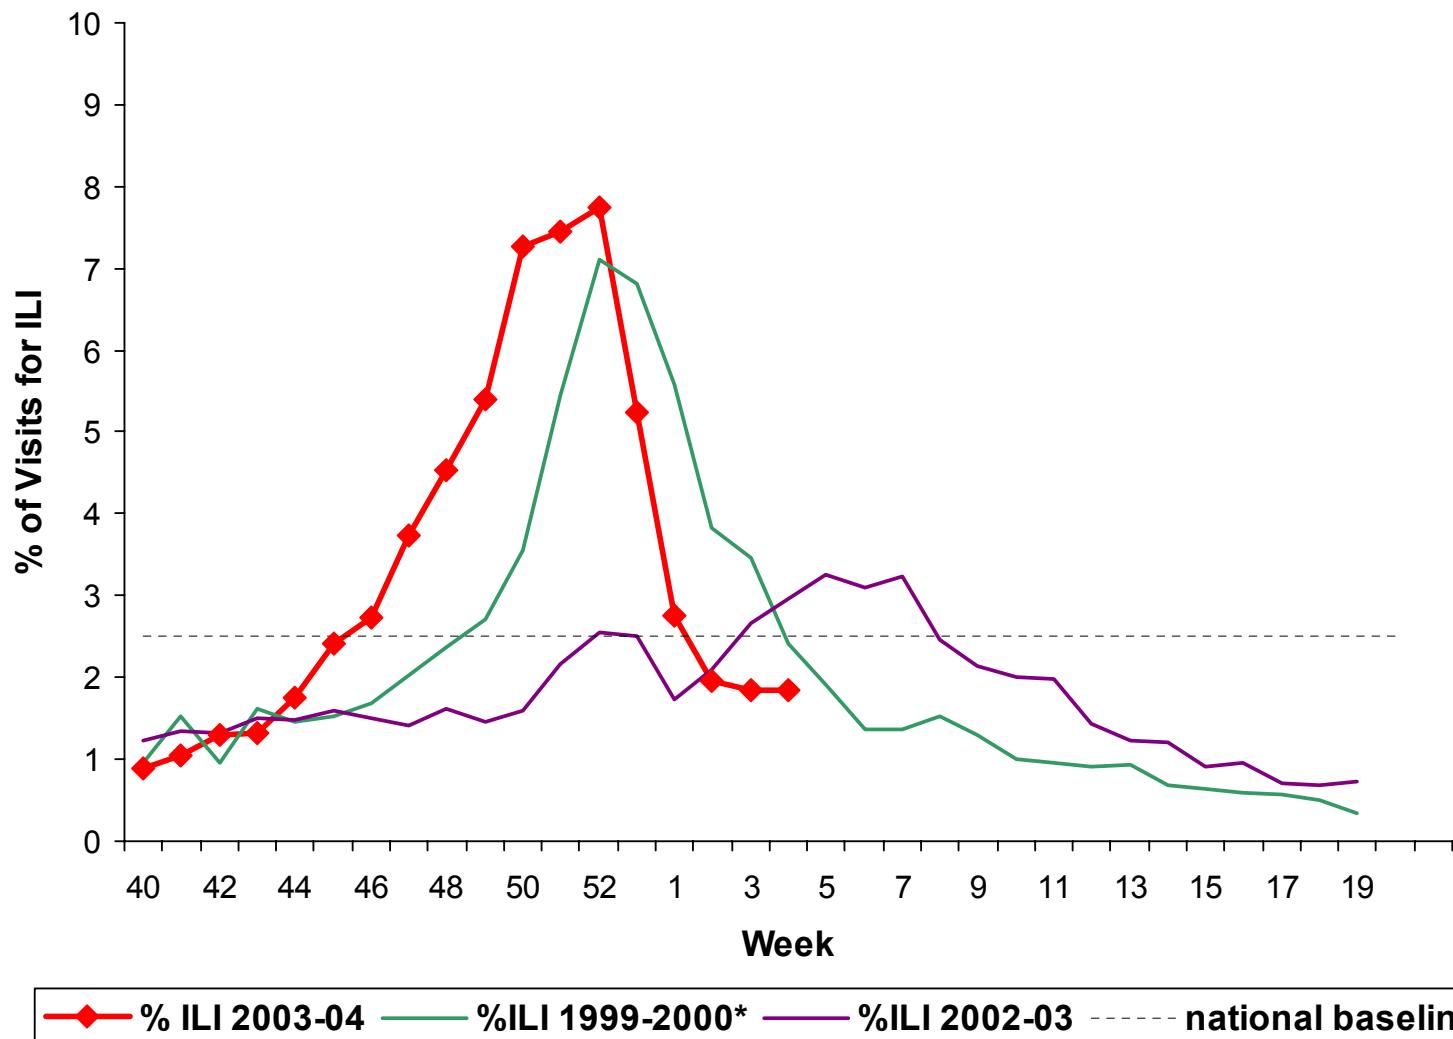

Pneumonia and Influenza Mortality for 122 U.S. Cities

Week Ending 01/31/2004

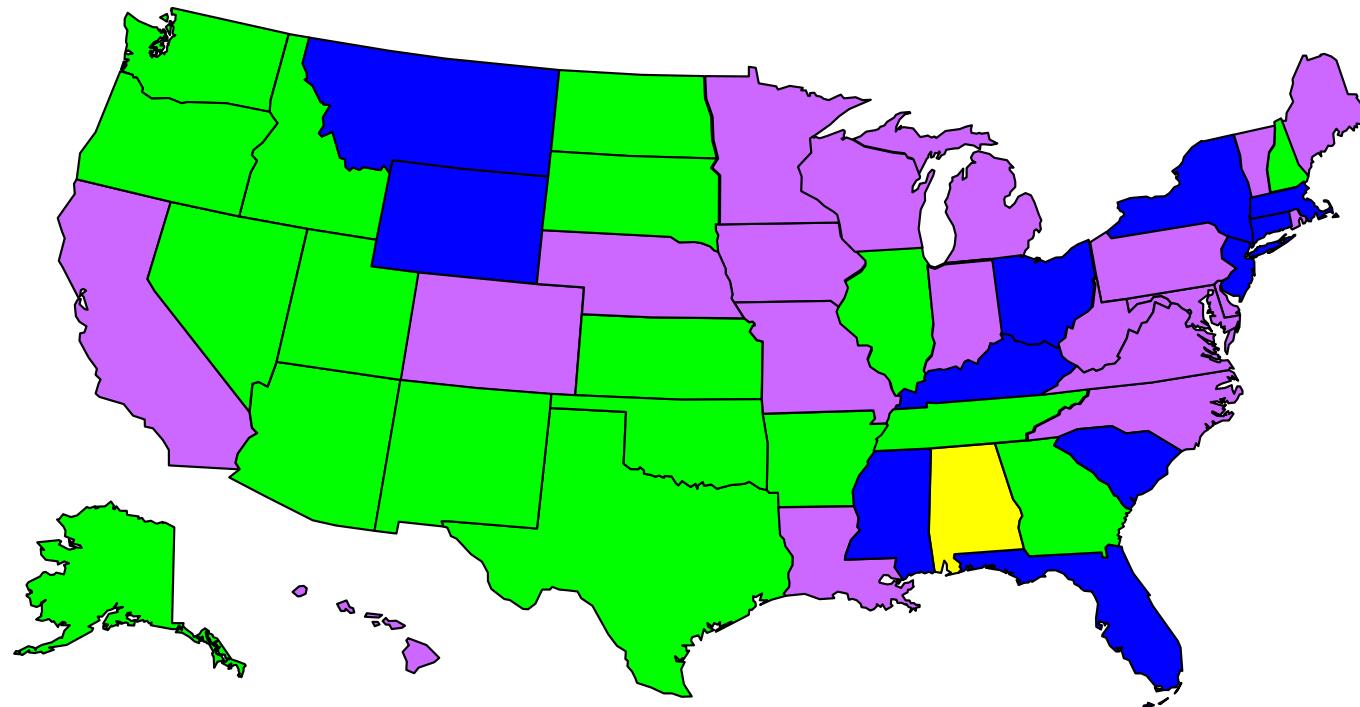

Percentage of Visits for Influenza-like Illness Reported by Sentinel Providers National Summary, 2003-04

* The 1999-2000 season was selected for comparison because it was the most recent A(H3N2) season of moderate severity.

1. Sera were kindly provided by Dr. Roland Levandowski, FDA, Bethesda, MD. The populations were vaccinated with the 2002-2003 trivalent influenza vaccine containing 15ug each of A/Panama/2007/99(H3N2)-like, A/New Caledonia/20/99(H1N1)-like, and B/Hong Kong/330/2001-like hemagglutinin.

2. Sera were kindly provided by Dr. John Wood, NIBSC, Hertfordshire, UK. The populations were vaccinated with the 2002-2003 trivalent influenza vaccine containing 15ug each of A/Panama/2007/99H3N2)-like, A/New Caledonia/20/99(H1N1)-like, and B/Shangdong/07/97-like hemagglutinin.

3. Sera were kindly provided by Dr. Takato Odagiri, WHO Collaborating Center, Tokyo, Japan. The populations were vaccinated with the 2003-2004 trivalent influenza vaccine containing 15ug each of A/Panama/2007/99H3N2)-like, A/New Caledonia/20/99(H1N1)-like, and B/Hong Kong/330/2001-like hemagglutinin.

4. Sera were kindly provided by Alan Hampson, WHO Collaborating Center, Melbourne, Australia. The populations were vaccinated with the 2003 trivalent influenza vaccine containing 15: g each of A/Panama/2007/99(H3N2)-like, A/New Caledonia/20/99(H1N1), and B/Shangdong/07/97-like hemagglutinin.

* A/Panama/2007/99 is the H3N2 component of the vaccine.
