

**Drug Safety and Risk Management Advisory Committee Meeting
February 9 and 10, 2006**

DRAFT Issues for Discussion-Day 1 (February 9, 2006)

1. What are the proper outcomes to study? Should ADHD drugs be studied by individual drug or by class? What are the proper age groups to study?
2. By what methods can studies identify and capture potential study confounders? What are the important confounders?
3. Please discuss the advantages and disadvantages to doing a case control study versus a cohort study for the sudden death and cardiovascular outcomes.
