Dear Administration,

We urge you to investigate Monsanto's application and recall rBGH. Bovine Growth Hormone has not been approved in any other country except the USA. In 1990, when the Food and Drug Administration approved that BGH was safe, many dairies began to use this product and suddenly there was a great outbreak of problems with their cows. This artificial method of having cows produce even more milk is not only cruel to these overused animals, but causes all sorts of illnesses that in turn require the use of antibiotics thus tainting our milk.

Finally, all of this caused additional research resulting in the discovery that the FDA should not have approved rBGH. Thirty percent of lab rats were fed rBGH for ninety days. The rats absorbed the genetically engineered material into their blood where it caused an antibody reaction. The researchers also found cysts on the thyroid glands of the male rats used in the research.

Once more, it is Monsanto that uses political pressure and incorrect research to further it's products.

We now demand that the Food and Drug Administration correct it's mistake immediately and withdraw rBGH from the market. It appears that the FDA had relied on Monsanto's research. Mistakes happen, but covering them up makes for more mistrust by the public. The public has the right to trust it's FDA, certainly in a Democracy as ours.

Please respond to these questions.

Sincerely,

*Lee Gooding*
