PHILIPS

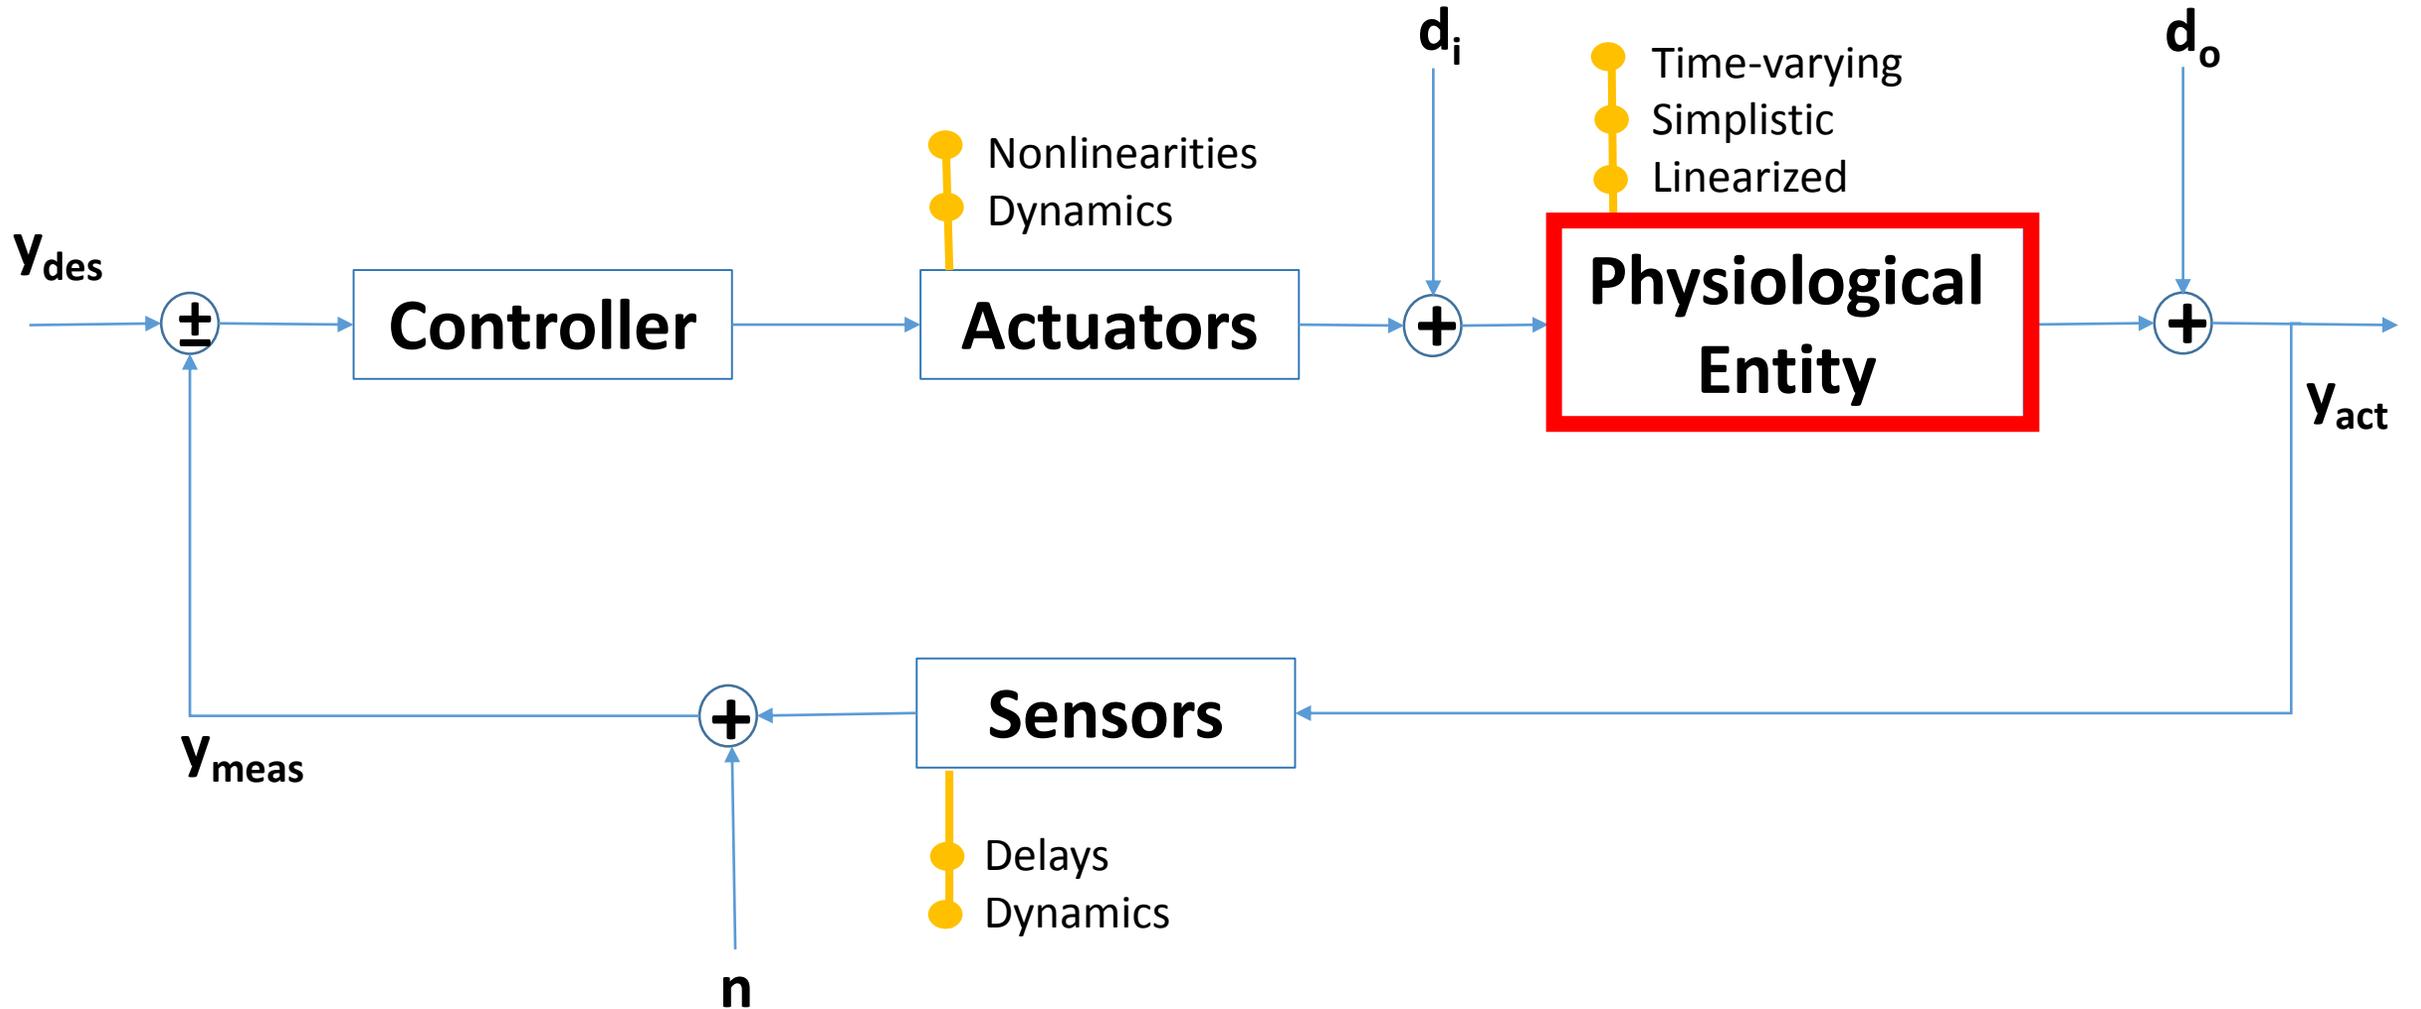

Physiological Closed-loop Control Medical Devices

- To implement a PCLC → need to design → need to simulate → need to model
- Need to model many blocks in a PCLC; this talk concentrates on the physiology
- The physiological entity that you plan to control need be understood
- Different rationales to model (why model?)
 - Ex: build PCLC, time scale of interest, what do you hope to capture
- Different ways of modeling (how to model?)
- Different uses of models (what model?)
 - prediction, what-if scenarios, detection, prognosis, education
- **Luckily**, well-established fields: steady-state models, dynamic models (ODEs, PDEs)

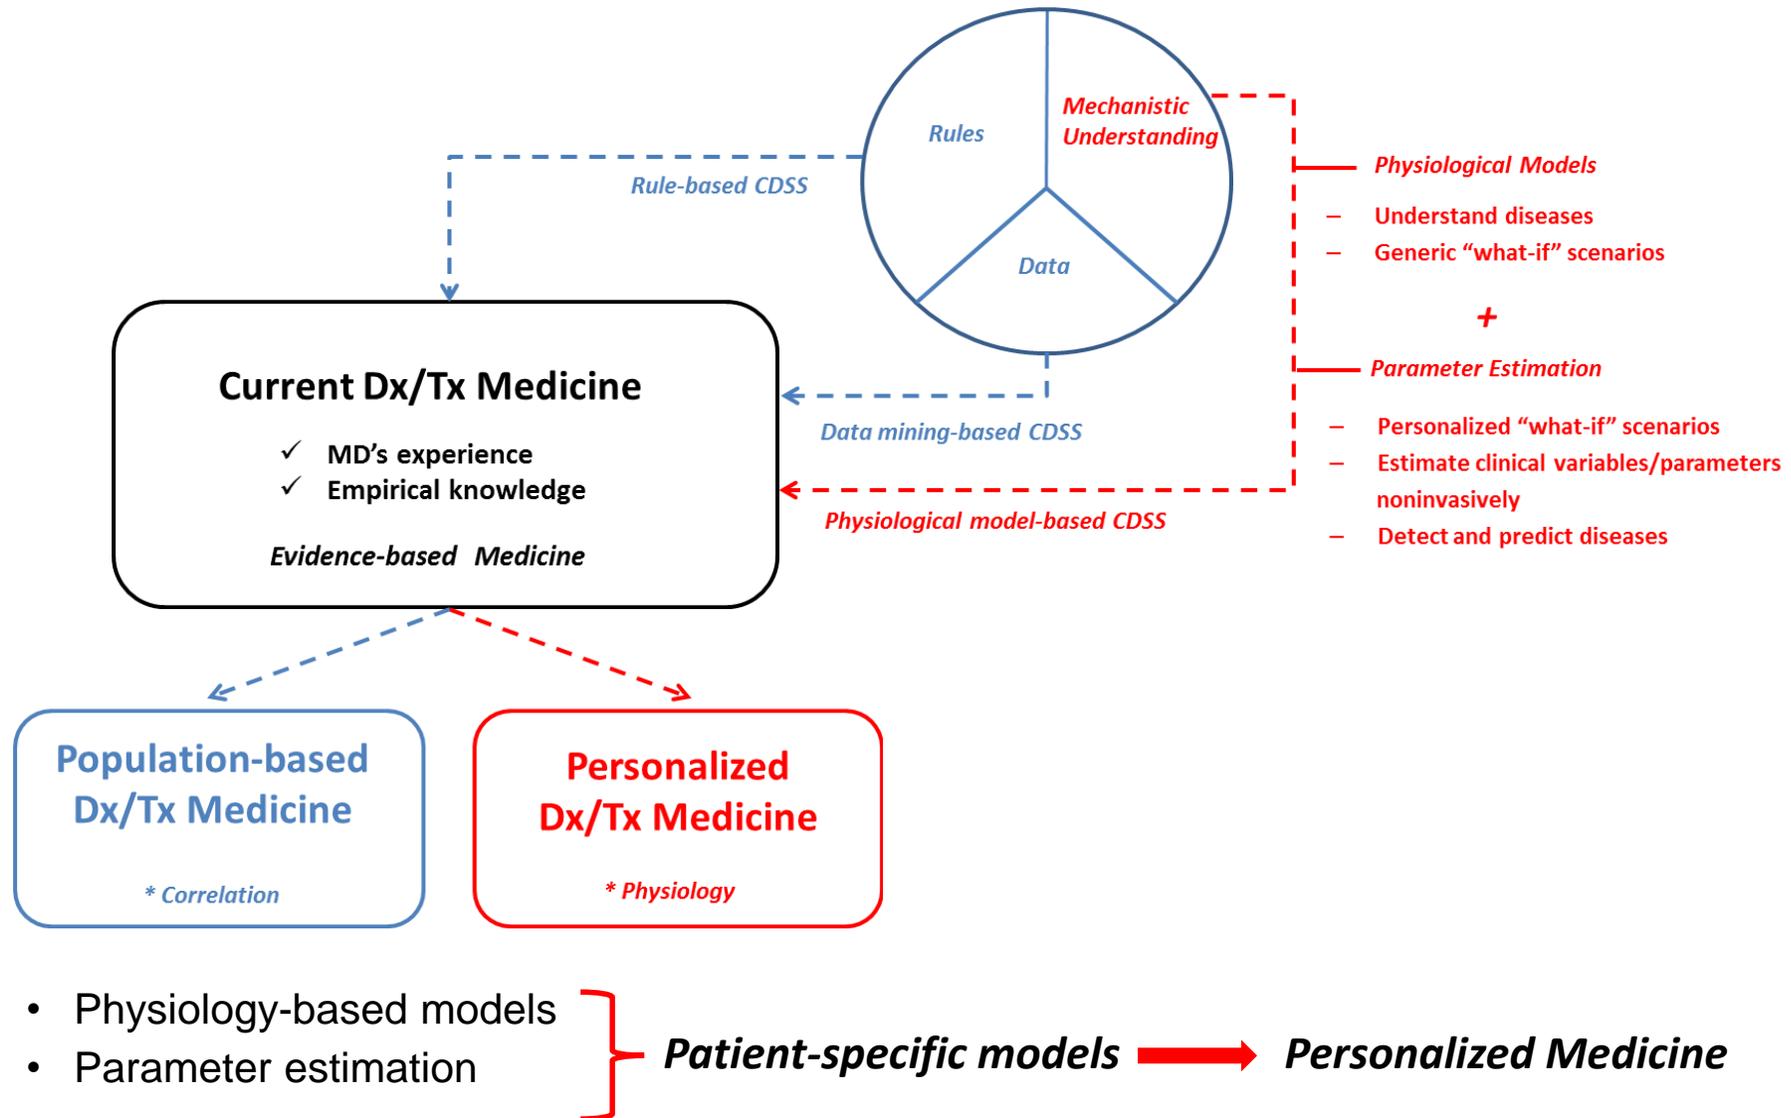

Physiological Closed-loop Control Devices

Basic feedback block diagram

Main design components

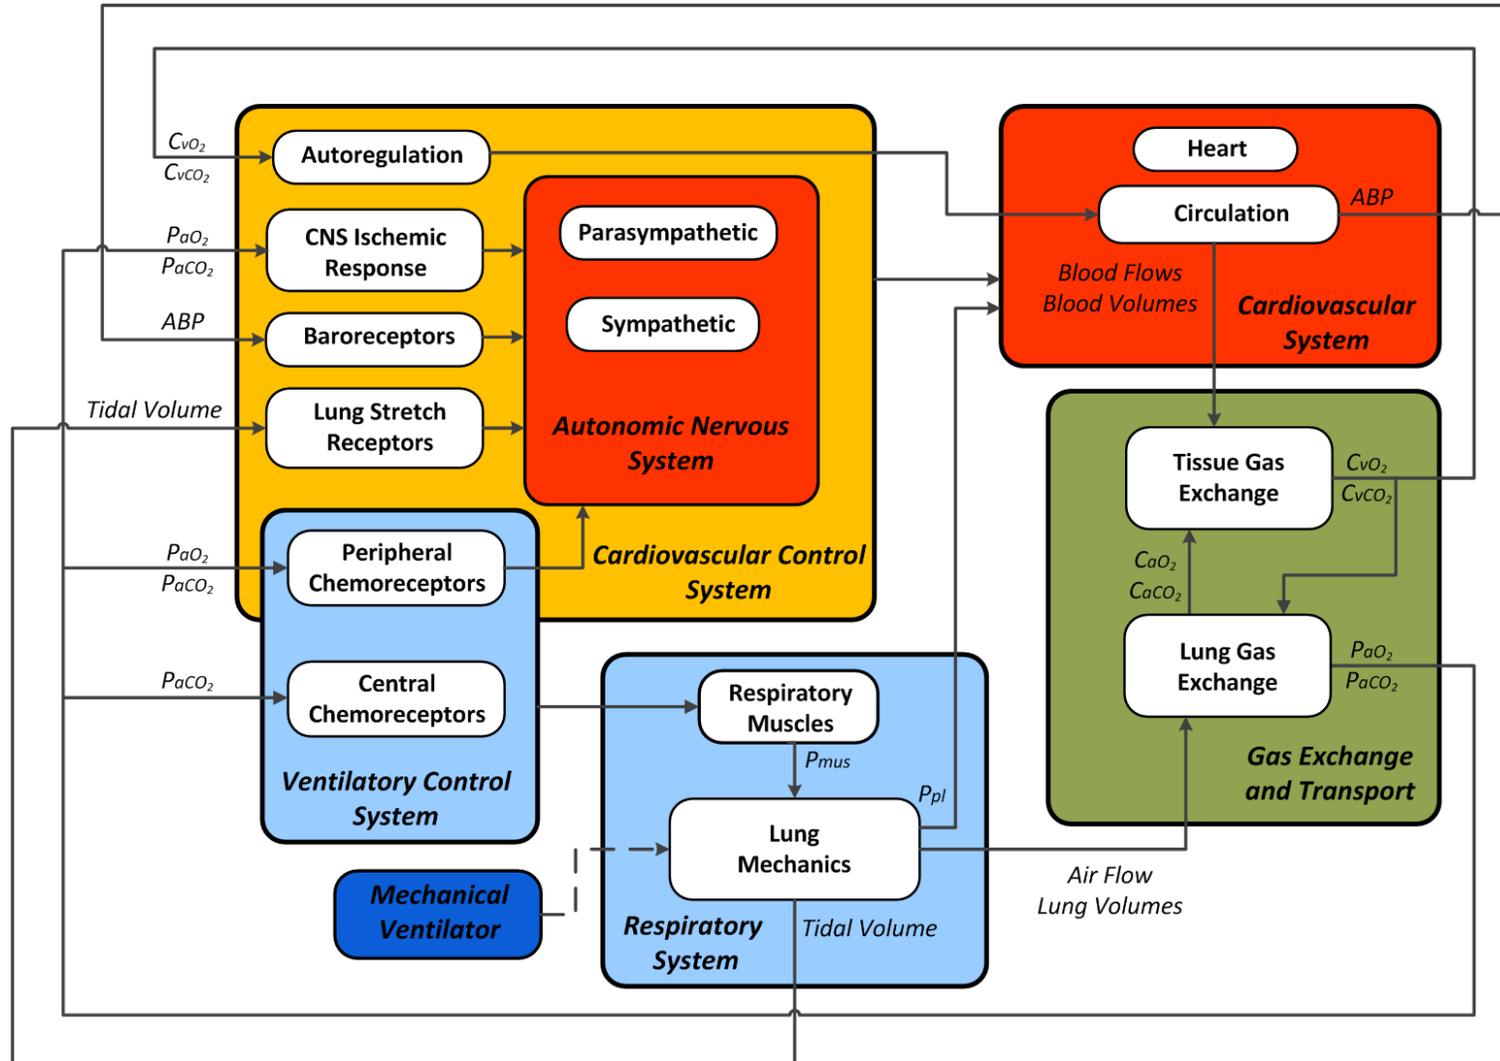

Physiological Modeling and... Personalized Medicine

- Physiology-based models
 - Parameter estimation
- } **Patient-specific models** → **Personalized Medicine**

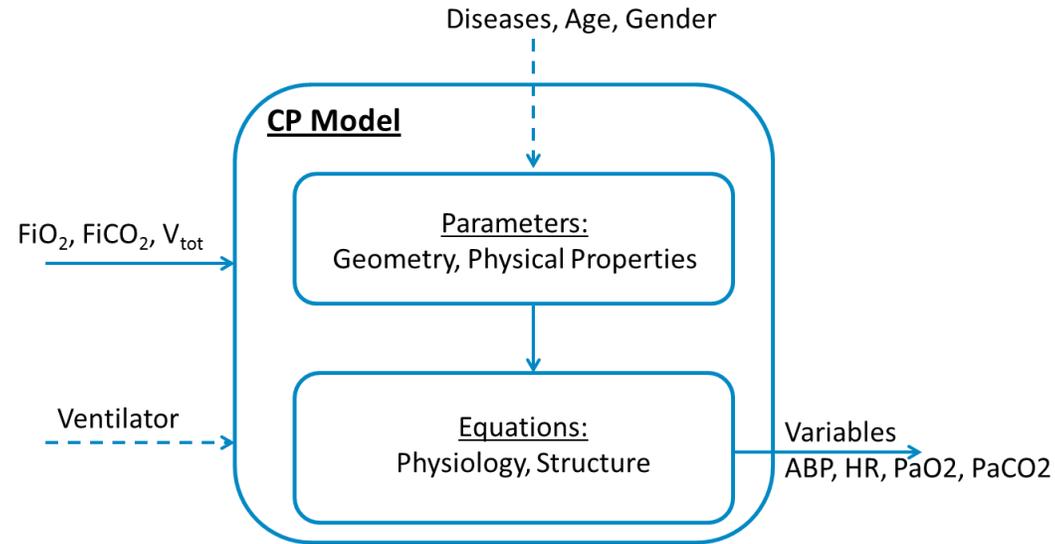

The Cardiopulmonary Model

Block Diagram

The Cardiopulmonary Model

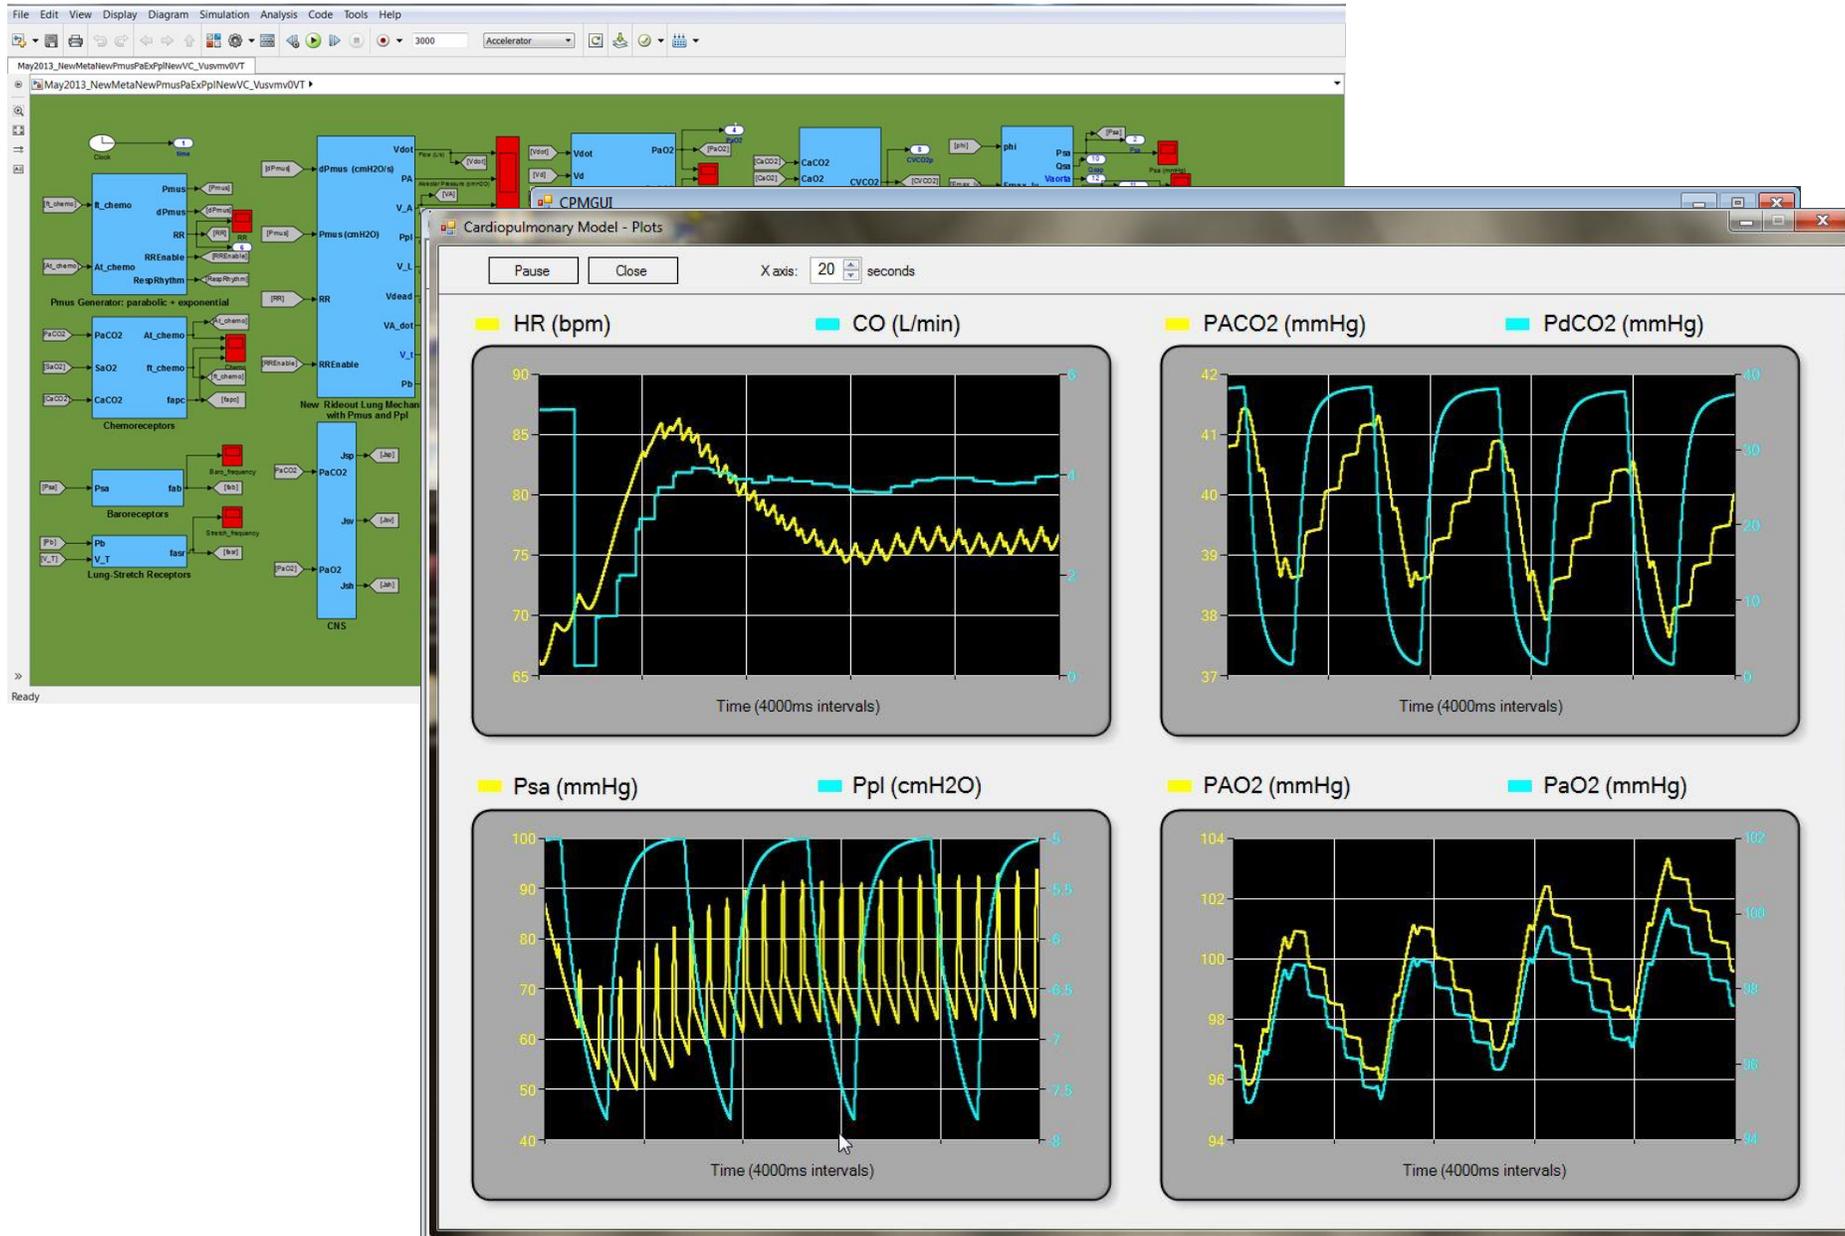

General Structure

NUMBER OF STATE VARIABLES, PARAMETERS AND OUTPUTS IN THE COMBINED CP MODEL

	State Variables	Parameters	Outputs
Cardiovascular System	17	74	43
Respiratory System	5	19	8
Gas Exchange and Transport	26	29	9
Cardiovascular Control	26	104	8
Respiratory Control	4	14	2
Total	78	240	70

Model Implementation

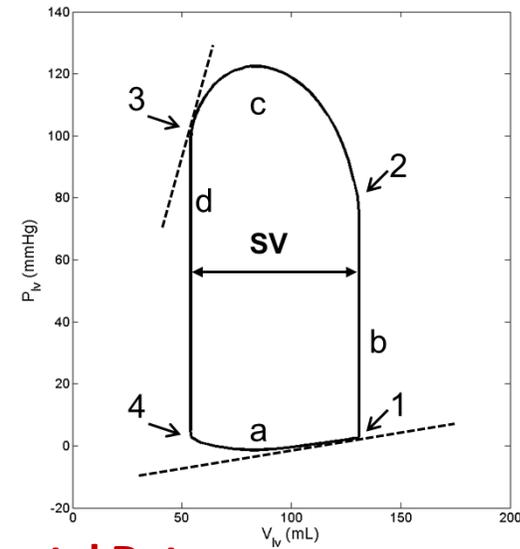

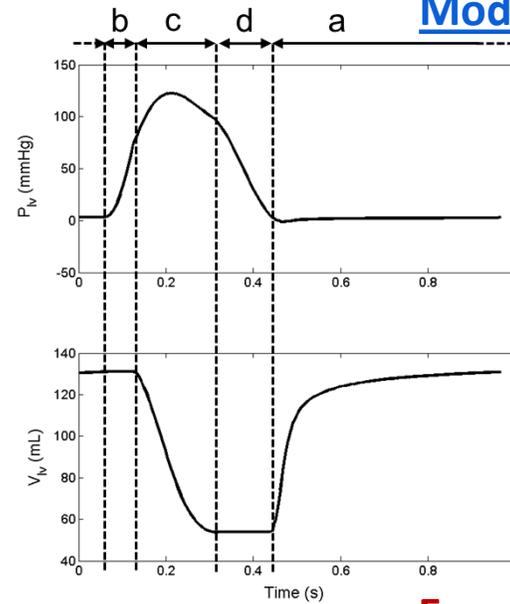

Model Verification and Validation

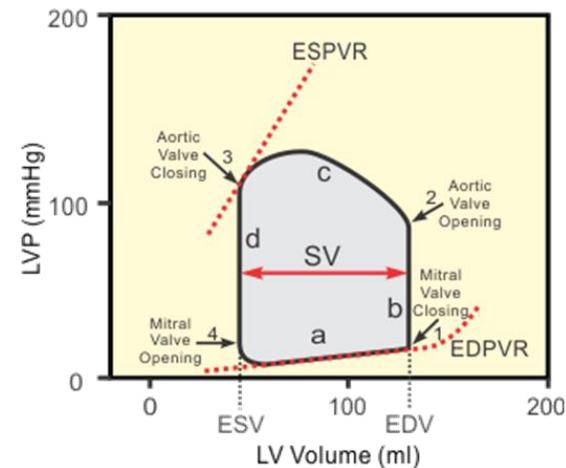

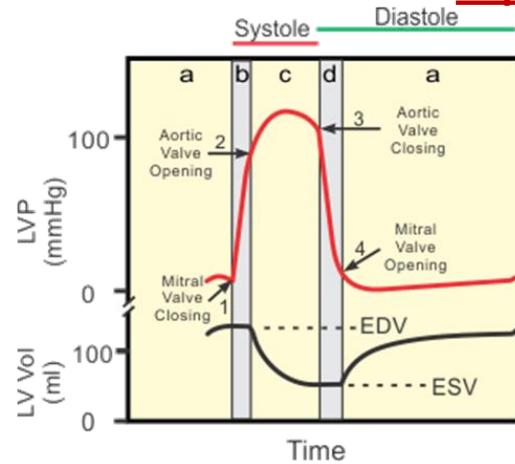

- Single set of parameters (240)
 - Average 70 Kg healthy subject
- Normal conditions
- Hypercapnia
- Hypoxia

Normal Conditions: Cardiovascular Variables

Model Simulations

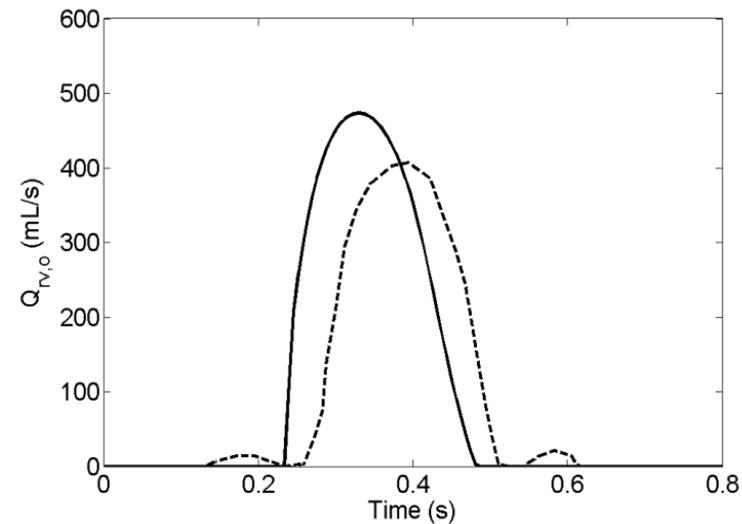

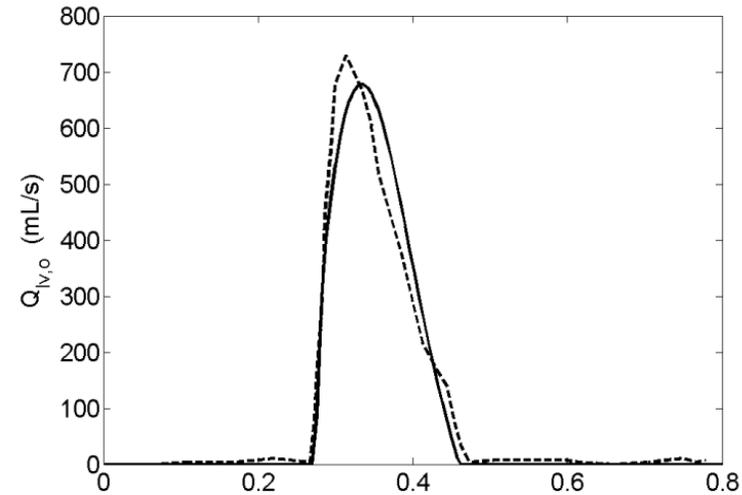

Experimental Data

Normal Conditions: Cardiovascular Variables

STATIC VALUES OF MAIN HEMODYNAMIC VARIABLES

Variable	Model Simulation	Normal Range
Arterial Pressure mmHg		
Mean	90.74	70-105 [86]
Systolic	122.79	90-140 [49]
Diastolic	78.86	60-90 [49]
Venae Cavae Pressure mmHg		
Systolic	3.79	2-14 [49]
Diastolic	2.72	0-8 [49]
Right Atrium Pressure mmHg		
Mean	0.7	2-6 [86]
Right Ventricle Pressure mmHg		
Systolic	24.45	15-28 [49]
Diastolic	-1.2	0-8 [49]
Pulmonary Artery Pressure mmHg		
Systolic	24.41	15-28 [49]
Diastolic	7.38	5-16 [49]
Left Atrium Pressure mmHg		
Mean	4	2-6 [86]
Left Ventricle Pressure mmHg		
Systolic	122.79	90-140 [49]
End-diastolic	0.2	4-12 [49]

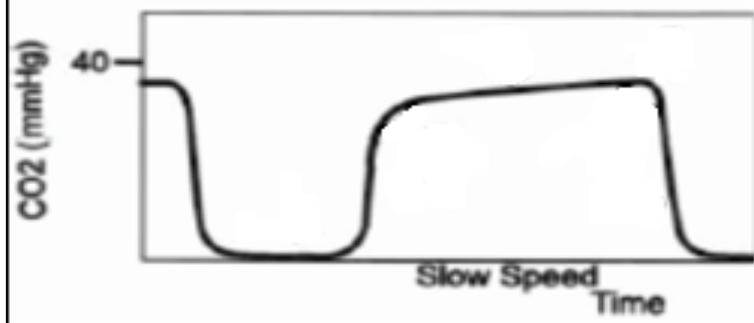

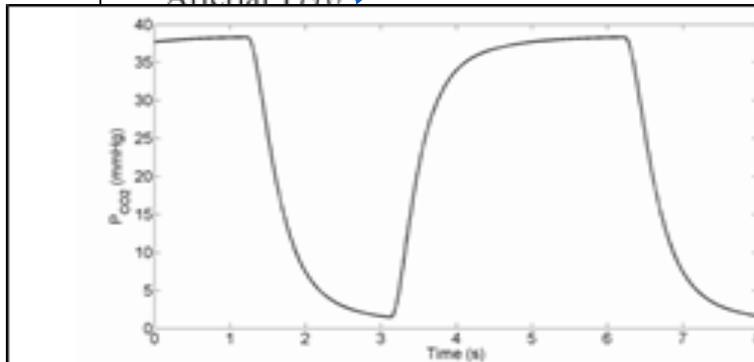

Normal Conditions: Gas Exchange Variables

MEAN VALUES OF MAIN GAS COMPOSITION VARIABLES

Variable	Model Simulation	N
Arterial P_{O_2} mmHg	98.9	10
Arterial P_{CO_2}		

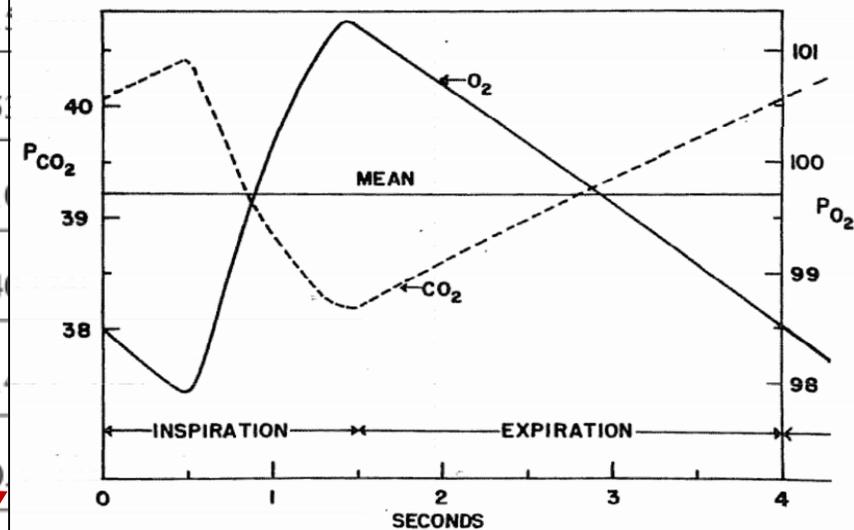

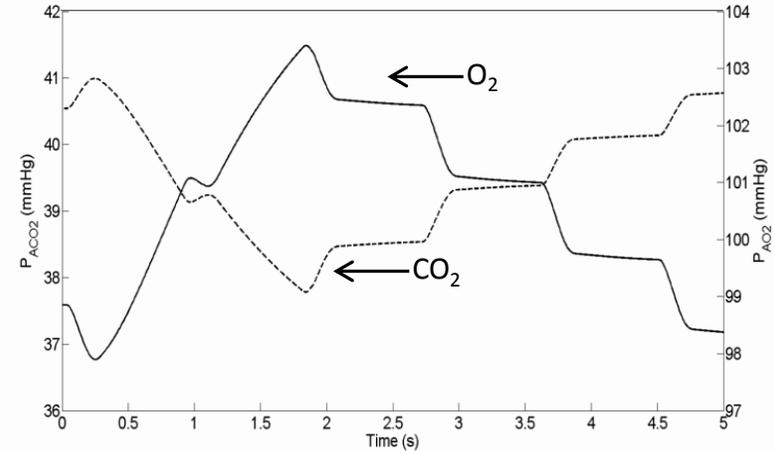

Model Simulations

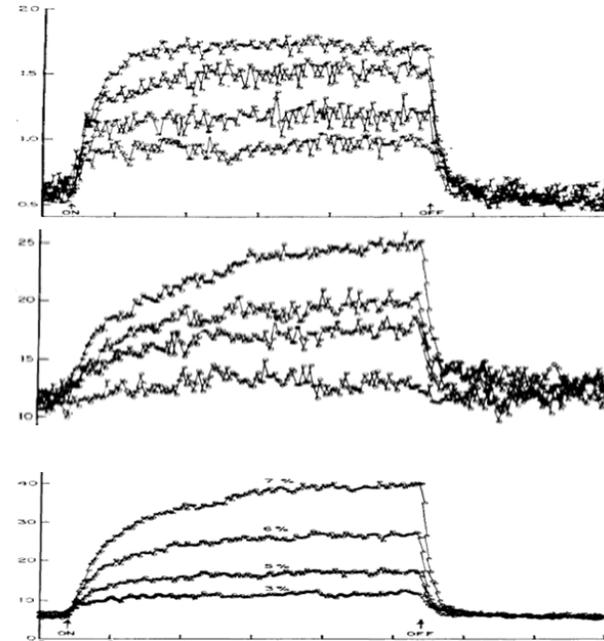

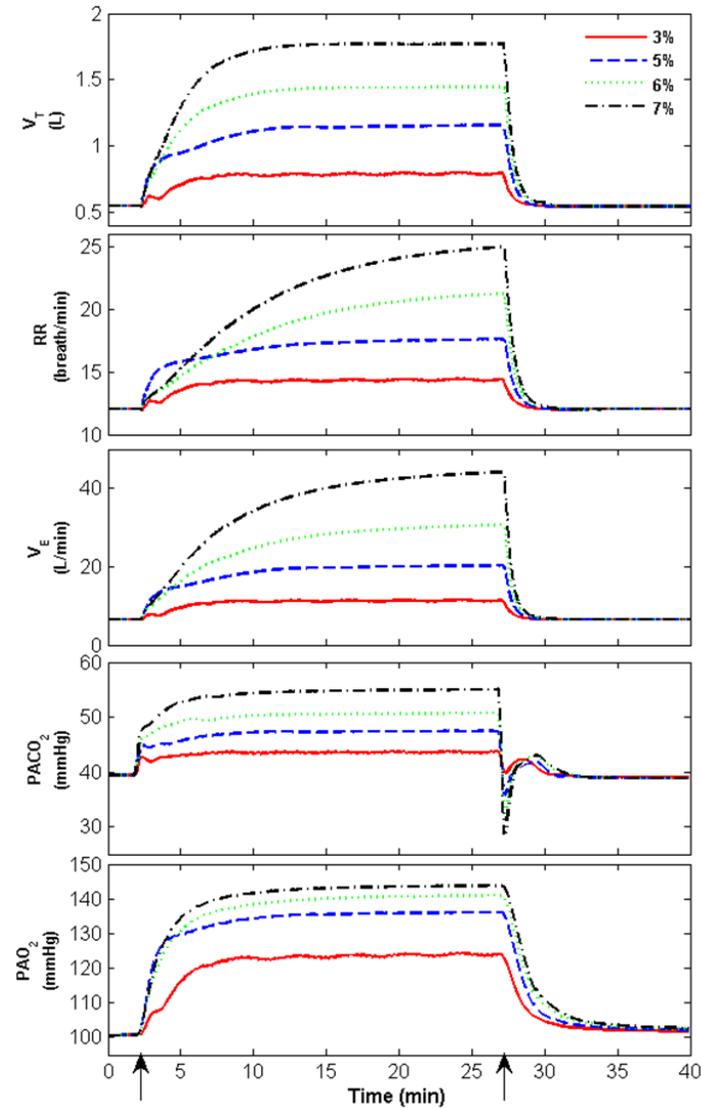

Alveolar P_{CO_2} mmHg	↑1.47*	
--------------------------	--------	--

* Alveolar P_{O_2} and P_{CO_2} are maximum and minimum values obtained within a respiratory cycle, respectively.

Experimental Data

Hypercapnia: Respiratory Variables

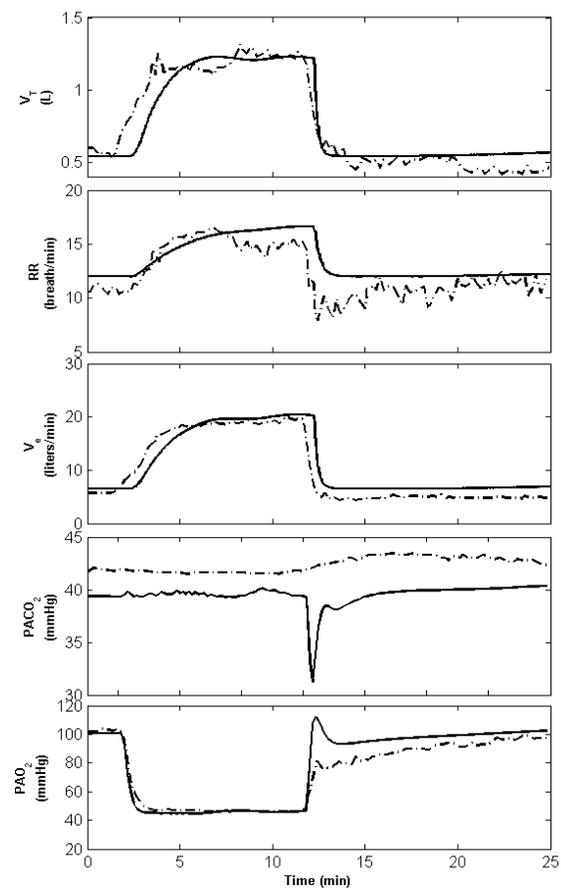

* Reynolds *et al.* (*J Appl Physiol*, 1972)
Averaged data from 15 subjects

Hypercapnia: Cardiovascular Variables

	7% CO ₂		8% CO ₂	
	Model	Kiely et al. (Chest, 1996) 10 subjects	Model	Mengesha (Ethiop J Health Dev, 2000) 8 subjects
Mean Δ HR (beat/min)	13.5 (+20%)	9.8 (+13.1%)	17.7 (+26.5%)	9.7
Mean Δ CO (L/min)	0.6 (+11.4%)	0.8 (+14.3%)	.86 (+16.2%)	
Mean Δ MAP(mmHg)	7.9 (+8.5%)	8.5 (+10.6%)	11.0 (+11.8%)	12.5
Mean Δ SBP(mmHg)	6.9 (+5.6%)	11 (+9.6%)	10.1 (+8.2%)	
Mean Δ DBP (mmHg)	8.4 (+10.8%)	6.4 (+10.1%)	11.4 (+14.6%)	
Mean Δ TPR (mmHg*s*L ⁻¹)	0 (0%)	~0	-0.004 (-.44%)	

Hypoxic Respiratory Responses

8% O₂ with controlled P_aCO₂

8% O₂ with uncontrolled P_aCO₂

— Model
 - - - Reynolds and Milhorn (*J Appl Physiol*, 1973)
 Averaged data from 10 subjects

* Reynolds and Milhorn (*J Appl Physiol*, 1973)
 Averaged data from 10 subjects

Ventilators (in the ICU)

- People are put on invasive ventilators:
 - After a surgery
 - Respiratory failure
- Mechanical ventilation: life saving procedure
- Need to minimize time on ventilator
- 6,000 new pts on ventilators daily in US (several days)
- 100,000 worldwide
- Improper ventilator settings → 

A 3D pie chart with two segments. A large green segment represents 'Vent Patients' and a smaller red segment represents 'VILI'. An arrow points from the text 'Improper ventilator settings' to the chart.
- Lung is 5 micron thin
 - Need right amount of pressure and flow
 - Settings are left for long periods
 - Patient conditions change
- Helping hand to the physician

Video of Patient Emulator on a Ventilator

Next Steps

Continue work on Physiologic Modeling

Continue research work on RT Parm Estim/System ID

Continue seeking clinical applications (baby steps)

Multi-institution Effort?

Thank you for your attention!
