REFERENCES	57

Overview

Each year, every sponsor of an approved or conditionally approved application for a new animal drug containing an antimicrobial active ingredient must report to the Food and Drug Administration (FDA) the amount of each such ingredient in these drug products sold or distributed for use in food-producing animals. FDA summarizes this information and makes it available to the public in annual summary reports.

This summary report presents the sales and distribution data for the 2014 calendar year for antimicrobial drugs approved for use in food-producing animals. This 2014 summary report also includes multiple years of domestic sales and distribution data of actively marketed antimicrobial drugs by medical importance, route of administration, and drug class, as well as observations on the changes in the sales and distribution of these drugs for 2014 compared with 2009, and changes in the sales and distribution of these drugs for 2014 compared with 2013.

Several observed trends include:

1. Domestic sales and distribution of antimicrobials approved for use in food-producing animals increased by 22% from 2009 through 2014, and increased by 4% from 2013 through 2014.
2. In 2014, domestic sales and distribution of medically important antimicrobials accounted for 62% of the domestic sales of all antimicrobials approved for use in food-producing animals. Tetracyclines accounted for 70% of these sales, penicillins for 9%, macrolides for 7%, sulfas for 5%, aminoglycosides for 3%, lincosamides for 2%, and cephalosporins and fluoroquinolones each for less than 1%.
3. Domestic sales and distribution of medically important antimicrobials approved for use in food-producing animals increased by 23% from 2009 through 2014, and increased by 3% from 2013 through 2014.
 - Tetracycline sales represent the largest volume of these domestic sales (6,600,849 kg in 2014), increasing by 25% from 2009 through 2014, and increasing 1% from 2013 through 2014.
 - Lincosamide sales volume showed the greatest percentage increase in domestic sales (150%) from 2009 through 2014, while sulfas sales volume showed the greatest percentage increase in domestic sales (18%) from 2013 through 2014.
4. The percentage of domestic sales and distribution of medically important antimicrobials approved for use in food-producing animals that have an approved indication for production use decreased from 72% to 68% from 2009 through 2012, but then remained unchanged at 72% from 2013 through 2014. This number does not represent sales attributable to products used solely for production indications because most of these products are also approved for therapeutic indications.
5. The percentage of domestic sales and distribution of medically important antimicrobials approved for use in food-producing animals that are sold over-the-counter (OTC) did not appreciably change from 2009 through 2014, going from 98% to 97%.

For more discussion of trends, see [Section VI.B. Multi-Year Trends \(2009-2014\)](#) below.

I. Background

Section 105 of the Animal Drug User Fee Amendments of 2008 (ADUFA) (P.L. 110-316; 122 Stat. 3509) amended section 512 of the Federal Food, Drug, and Cosmetic Act (“the Act”) [21 U.S.C. 360b] to

require that sponsors of approved and conditionally approved applications for new animal drugs containing an antimicrobial active ingredient submit an annual report to the Food and Drug Administration (FDA) on the amount of each such ingredient in the drug that is sold or distributed for use in food-producing animals, including information on any distributor-labeled product. This legislation was enacted to assist FDA in its continuing analysis of the interactions (including antimicrobial resistance), efficacy, and safety of antimicrobials approved for use in both humans and food-producing animals (see H. Rpt. 110-804).

Under section 512(l)(3) of the Act [21 U.S.C. 360b(l)(3)], each report submitted to the FDA must specify the amount of each antimicrobial active ingredient (1) by container size, strength, and dosage form; (2) by quantities distributed domestically and quantities exported; and (3) by dosage form, including, for each such dosage form, a listing of the target animals, indications, and production classes that are specified on the approved label of the product. Sponsors of antimicrobial drug applications that are approved and labeled for use in more than one food-producing animal species are not required to report sales and distribution information for each individual animal species listed on a product's approved label. Only total product sales information is required. Each year's report provides monthly sales and distribution data for the preceding calendar year and must be submitted to FDA no later than March 31. These reports are separate from periodic drug experience reports that are required under 21 CFR 514.80(b)(4).

Under section 512(l)(3)(E) of the Act [21 U.S.C. 360b(l)(3)(E)], FDA is directed to make annual summaries of the information reported by animal drug sponsors publicly available by antimicrobial class.

II. Scope of Reporting

This summary report includes sales and distribution data of antimicrobial drugs that are specifically approved for antibacterial uses or are known to have antibacterial properties. Antifungal and antiviral drugs are not included in this report because, with the exception of formalin and hydrogen peroxide water immersion products, there are currently no approved drug applications actively marketed for these purposes in food-producing animals. Antiprotozoal drugs without antibacterial properties (e.g., amprolium) are also not included.

Many antimicrobial animal drugs are approved and labeled for use in multiple species. Under section 512(l)(3)(B)(iii) of the Act [21 U.S.C. 360b(l)(3)(B)(iii)], each report submitted to the FDA must specify "a listing of the target animals...that are specified on the approved label of the product." However, sponsors are not required to provide a breakdown of sales by individual target animal species. They report sales totals reflecting combined data for all species listed on the approved label; therefore, this summary report does not include summaries of sales by individual animal species.

Some antimicrobial drug applications include approved products that are labeled for use in both food-producing animal species (e.g., cattle and swine) and nonfood-producing animal species (e.g., dogs and cats). As noted above, because product sales and distribution information is not provided to FDA broken out by species, this summary report does not include information indicating what proportion of antimicrobial drugs was sold for use in food-producing animals and what proportion was sold for use in nonfood-producing animals.

The data included in the 2014 annual summary report differ in some cases from previously published reports. These differences may be attributed to updated sales information provided by sponsors for previous reporting years. Additionally, the data reflect changes in the inclusion criteria for the aminoglycoside drug class, which was updated to include hygromycin B as an ingredient.

III. Protecting Confidential Information

This report is designed to provide useful information to the public while, at the same time, meeting the requirement of section 512(l)(3)(E) of the Act [21 U.S.C. 360b(l)(3)(E)] to report summary data in a manner consistent with protecting both national security and confidential business information. In accordance with statutory requirements designed to protect confidential business information, annual sales and distribution data are summarized by antimicrobial drug class and only those antimicrobial drug classes and other categories with three or more distinct sponsors of approved and actively marketed animal drug products are independently reported. Antimicrobial drug classes with fewer than three distinct sponsors are reported collectively as “Not Independently Reported” (NIR). The number of distinct sponsors in a particular antimicrobial class or other category is determined by two criteria: (1) the sponsor must be named in 21 CFR 510.600 as the holder of an approved application for an animal drug product in that particular class or category on the last day of the annual reporting period, and (2) the sponsor must have actively sold or distributed such animal drug product at some point during that annual reporting period. This same principle is utilized with the representation of any category included in this report.

Occasionally instances arise in which two or more individual pieces of summary data, when viewed together, can be utilized to derive other data that would reveal confidential business information (sometimes referred to as “the mosaic effect”). FDA believes the broad requirement to protect confidential business information means that we cannot independently report summary data that can be used together with summary data presented elsewhere in the report or data already in the public domain to indirectly derive confidential business information. In these instances, to protect the confidential business information that could be revealed by including such summary data, these categories will be reported collectively as “Other” (e.g., Table 7).

IV. Use of the Summary Information

The totals in this summary report represent sales and distribution data for antimicrobial drugs approved for use in food-producing animals. However, in reviewing this report it is important to keep in mind that there are certain inherent limitations on how the data provided in this report may appropriately be interpreted and used. For example, the sales and distribution data submitted by animal drug sponsors and summarized in this report are not indicative of how these antimicrobial drugs were actually used in animals (e.g., in what species and for what indications). With the exception of medicated feeds and certain drugs that are specifically prohibited from extralabel use (listed in FDA’s regulations at 21 CFR 530.41), veterinarians can legally use approved animal drugs for species and therapeutic indications for which the drugs were not approved. Further, because the majority of antimicrobial drugs used in animal feed are approved for multiple indications, simply knowing that the route of administration for a drug is, for example, by oral means through animal feed cannot, by itself, be used to determine the indication for which the drug was used. As discussed in [Section V.A. Description of Tables and Figures](#), some of the antimicrobials included in this summary report are approved for use in both food- and nonfood-producing animals. Many of the applications are approved and labeled for use in multiple species, for multiple indications, and with multiple dosage regimens. In addition, some applications are approved for multiple routes of administration, and as OTC and prescription drugs. These points should be carefully considered when interpreting or comparing the data presented in this summary report. It is also important to note that animal drug sales data represent a summary of the volume of product sold or distributed through various outlets by the manufacturer intended for sale to the end user, not the volume of product ultimately purchased by the end user for administration to animals. Because of all these variations, assumptions cannot be made about actual product use.

Readers might want to compare the information in this summary report with information published elsewhere regarding sales and distribution of antimicrobial drugs for use in humans. However, before

making comparisons between human and animal drug sales and distribution data, a number of differences in the circumstances in which antimicrobial drugs are used in human and veterinary medicine must be carefully considered, including:

- The number of humans in the population compared to the much larger number of animals in each of the many animal species.
- The differences in physical characteristics of humans compared to various animal species (e.g., weight and physiology).
- Duration and dosage of antibacterial drug administration may also vary by indication and, in general, between the various animal species and humans due to differences in physiology.
- As noted above, the available animal sales and distribution data are not reported to the FDA by each use indication and, thus, do not allow the FDA to distinguish between or among the different types of uses. The data, therefore, do not allow a direct comparison of the amounts of antimicrobials sold for certain human uses with those sold for certain animal uses.
- Veterinarians commonly utilize human antimicrobial drugs in their companion animal patients; therefore, amounts presented for certain human antimicrobial drugs may represent some unknown portion sold for use in companion animals.

It is, therefore, difficult to draw definitive conclusions from any direct comparisons between the quantity of antimicrobial drugs sold for use in humans and the quantity sold for use in animals.

V. Description of Tables and Figures

The information presented in the following tables is based on annual sales and distribution data. Please note that the number of marketed products and associated sponsors may vary from year to year; thus, the categories presented in the tables may also vary from year to year to meet the requirements for protecting confidential business information. Any yearly variations in categories presented may make it difficult to directly compare certain tabular data between reported years. Furthermore, FDA occasionally receives updates or corrections to previously submitted 512(l)(3) data from animal drug sponsors at various times after the March 31 deadline. Therefore, minor variations in tabular data may occur over time depending on when these summary data are generated.

A. Current Reporting Year Sales and Distribution Information

[Table 1 – Actively Marketed Antimicrobial Drugs, Listed by Class](#)

[Figure 1a – Actively Marketed Antimicrobial Drugs, Reported by Number of Drug Applications](#)

[Figure 1b – Actively Marketed Antimicrobial Drugs, Reported by Number of Unique Sponsors](#)

Table 1 provides a list of all antimicrobial active ingredients approved for use in food-producing animals, broken out by antimicrobial drug classes, that were actively marketed during the current reporting year. There are various active ingredients and drug classes that are approved for use in food-producing animals but for which products have not been marketed in any given year for a variety of reasons (some have not been marketed for decades). These non-marketed active ingredients and drug classes are not represented in this table or in the other tables in this summary report. For a listing of all FDA-approved animal drugs, regardless of their marketing status, see “Animal Drugs@FDA” (<http://www.accessdata.fda.gov/scripts/animaldrugsatfda/>) or the in the

“Green Book,”

(<http://www.fda.gov/AnimalVeterinary/Products/ApprovedAnimalDrugProducts/default.htm>).

Table 1 also identifies those antimicrobial active ingredients and drug classes that are considered to be “medically important” in human medical therapy. The basis of these designations is provided in FDA Guidance for Industry (GFI) #213, which states that all antimicrobial drugs and their associated classes listed in Appendix A of the FDA’s GFI #152 are considered “medically important.” Hyperlinks to these documents can be found at the end of this document.

Conversely, for the purposes of this summary report, antimicrobial active ingredients and drug classes not listed in Appendix A of GFI #152 are considered to be “not currently medically important” in human medical therapy. Some of the active ingredients and drug classes that fall into this category are only used in veterinary medicine, e.g., ionophores, and are not generally associated with antimicrobial resistance issues.

Table 1 also identifies those active ingredients that are components of animal drug applications approved for use in both food-producing animals (e.g., cattle and swine) and nonfood-producing animals (e.g., dogs and cats). While FDA generally no longer approves single products for use in both categories of animals, a limited number of such products still remain on the market. The “medically important” active ingredients associated with applications approved for both food- and nonfood-producing species include ceftiofur, lincomycin, ampicillin, penicillin, sulfamethazine, and oxytetracycline. Please note that product sales volume for these applications is very small compared to product sales volume for other applications with the same active ingredients that are approved for use solely in food-producing animals. The two other data compilations associated with Table 1, Figures 1a and 1b, provide additional summary data for classes of antimicrobial drugs approved for use in food-producing animals that were actively marketed in the current reporting year. Figure 1a provides the number of approved animal drug applications for products currently being marketed for each antimicrobial drug class listed in Table 1. The reader should note that some animal drug applications include more than one antimicrobial active ingredient, each of which is normally associated with a different antimicrobial drug class. Because all of the antimicrobial active ingredients included in a multiple-ingredient application are represented in Figure 1a, such applications will be represented more than once. It should also be noted that the number of animal drug applications represented for an antimicrobial active ingredient does not necessarily correlate with the volume of sales and distribution for those active ingredients.

Figure 1b provides the number of distinct sponsors of the approved animal drug applications for products that are currently marketed for each antimicrobial drug class listed in Table 1.

[Figure 2 – Domestic/Export Sales and Antimicrobial Drug Class](#)

Table 2 and Figure 2 provide total annual domestic and export sales and distribution data of antimicrobial active ingredients approved for use in food-producing animals, reported by antimicrobial drug class.

[Click here for narrative observations regarding the current reporting year \(2014\): Actively marketed antimicrobial drugs](#)

[Table 3 – Domestic Sales: Medical Importance and Antimicrobial Drug Class](#)

[Figure 3 – Domestic Sales: Medical Importance and Antimicrobial Drug Class](#)

Table 3 and Figure 3 provide total annual domestic sales and distribution data of antimicrobial drugs approved for use in food-producing animals categorized by: (1) importance in human medical therapy [[see Table 1 discussion on “medical importance”](#)]; and (2) antimicrobial drug class.

[Click here for narrative observations regarding the current reporting year \(2014\): Domestic Sales - Medically important antimicrobial drugs and drug class](#)

[Click here for narrative observations regarding the current reporting year \(2014\): Domestic Sales - Antimicrobial drugs not currently medically important and drug class](#)

[Table 4 – Domestic Sales: Medical Importance and Route of Administration](#)

[Figure 4 – Domestic Sales: Medical Importance and Route of Administration](#)

Table 4 and Figure 4 provide data on the total annual domestic sales and distribution of antimicrobial drugs approved for use in food-producing animals categorized by: (1) importance in human medical therapy [[see Table 1 discussion on “medical importance”](#)]; and (2) route of administration.

[Click here for narrative observations regarding the current reporting year \(2014\): Domestic Sales - Medically important antimicrobial drugs and route of administration](#)

[Click here for narrative observations regarding the current reporting year \(2014\): Domestic Sales - Antimicrobial drugs not currently medically important and route of administration](#)

[Table 5 – Domestic Sales: Medical Importance and Indications](#)

Figure 5 – Domestic Sales: Medical Importance and Indications

Table 5 and Figure 5 provide total annual domestic sales and distribution data of antimicrobial drugs approved for use in food-producing animals categorized by: (1) importance in human medical therapy [[see Table 1 discussion on “medical importance”](#)]; and (2) approved label indications. Indications are either therapeutic (e.g., treatment, prevention, or control of disease) or for production (e.g., increased weight gain or improved feed efficiency). Please note that most products approved for production indications are also approved for therapeutic indications.

[Click here for narrative observations regarding the current reporting year \(2014\): Domestic Sales - Medically important antimicrobial drugs and indications](#)

[Click here for narrative observations regarding the current reporting year \(2014\): Domestic Sales - Antimicrobial drugs not currently medically important and indications](#)

Table 6 – Domestic Sales: Medical Importance and Dispensing Status

Figure 6 – Domestic Sales: Medical Importance and Dispensing Status

Table 6 and Figure 6 provide total annual domestic sales and distribution data of antimicrobial drugs approved for use in food-producing animals categorized by: (1) importance in human medical therapy [[see Table 1 discussion on “medical importance”](#)]; and (2) dispensing status (i.e., prescription, OTC, or VFD). A prescription product requires a valid prescription order from a licensed veterinarian to be dispensed. An OTC product can be dispensed to anyone without an order from a veterinarian. Under 21 CFR 558.3(a)(6), a VFD drug is a drug provided through feed that requires a written statement from a veterinarian in the context of a valid veterinarian-client-patient relationship in order to be dispensed. Certain applications are approved with both a prescription and OTC dispensing status (Rx/OTC).

[Click here for narrative observations regarding the current reporting year \(2014\): Domestic Sales - Medically important antimicrobial drugs and dispensing status](#)

[Click here for narrative observations regarding the current reporting year \(2014\): Domestic Sales - Antimicrobial drugs not currently medically important and dispensing status](#)

Table 7 – Domestic Sales: Medical Importance, Route of Administration, and Drug Class

Figure 7 – Domestic Sales: Medical Importance, Route of Administration, and Drug Class

Table 7 and Figure 7 provide total annual domestic sales and distribution data of antimicrobial drugs approved for use in food-producing animals categorized by: (1) importance in human medical therapy [[see Table 1 discussion on “medical importance”](#)]; (2) route of administration; and (3) antimicrobial drug class. In effect, Table 7 and Figure 7 provide another level of

stratification (i.e., antimicrobial drug class) than provided in Table 4 and Figure 4. Given the requirement in section 512(l)(3) of the Act [21 U.S.C. 360b(1)(3)] for FDA to protect confidential business information, this additional stratification by antimicrobial drug class necessitates that the number of categories reported out for route of administration is fewer compared to those reported out in Table 4.

[Click here for narrative observations regarding the current reporting year \(2014\): Domestic Sales - Medically important antimicrobial drugs by route of administration and drug class](#)

[Click here for narrative observations regarding the current reporting year \(2014\): Domestic Sales - Antimicrobial drugs not currently medically important by route of administration and drug class](#)

B. Multi-Year Trends of Sales and Distribution Information

The purpose of the multi-year trend information is to demonstrate patterns or trends of the sales and distribution of antimicrobial drugs approved for use in food-producing animals over time. It should be noted that from year to year, various categories may expand or combine as the number of sponsors in any given category go above or below three, the number considered critical for protecting confidential business information.

[Figure 8a – Domestic Sales: Actively Marketed Antimicrobial Drugs, Reported by Number of Drug Applications](#)

[Figure 8b – Domestic Sales: Actively Marketed Antimicrobial Drugs, Reported by Number of Unique Sponsors](#)

These figures provide information regarding domestic sales and distribution of antimicrobial drugs approved for use in food-producing animals for multiple years in the same manner as described in Figures 1a and 1b. Figure 8a provides the number of approved animal drug applications for products marketed in each reported year for every antimicrobial drug class listed in Table 1 of that year's Summary Report. The reader should note that some animal drug applications include more than one active ingredient. These applications are commonly referred to as "combination" applications. Some combination applications contain more than one antimicrobial active ingredient, each of which is normally associated with a different antimicrobial drug class. Because all of the antimicrobial active ingredients included in a multiple-ingredient application are represented in Figure 8a, such applications will be represented more than once. It should also be noted that the number of animal drug applications represented for an antimicrobial active ingredient does not necessarily correlate with the volume of sales and distribution for those active ingredients.

Figure 8b provides the number of distinct sponsors of the approved animal drug applications for products marketed in each reported year for every antimicrobial drug class listed in Table 1 of that year's Summary Report.

[Click here for narrative observations regarding multi-year trends \(2009-2014\): Domestic Sales - Actively marketed antimicrobial drug sponsors and applications](#)

[Table 9 – Domestic/Export Sales and Antimicrobial Drug Class](#)

[Figure 9 – Domestic/Export Sales and Antimicrobial Drug Class](#)

This table and figure provide total annual domestic and export sales and distribution data of antimicrobial drugs approved for use in food-producing animals for multiple years in the same manner as described in Table 2 and Figure 2 (i.e., categorized by antimicrobial drug class).

[Click here for narrative observations regarding multi-year trends \(2009-2014\): Domestic Sales - Actively marketed antimicrobial drugs](#)

[Table 10 – Domestic Sales: Medical Importance and Antimicrobial Drug Class](#)

[Figure 10 – Domestic Sales: Medical Importance and Antimicrobial Drug Class](#)

This table and figure provide total annual domestic sales and distribution data of antimicrobial drugs approved for use in food-producing animals for multiple years in the same manner as described in Table 3 and Figure 3 (i.e., categorized by: (1) importance in human medical therapy [see Table 1 discussion on “medical importance”]; and (2) antimicrobial drug class).

[Click here for narrative observations regarding multi-year trends \(2009-2014\): Medically important antimicrobial drugs and drug class](#)

[Click here for narrative observations regarding multi-year trends \(2009-2014\): Antimicrobial drugs not currently medically important and drug class](#)

[Table 11a – Domestic Sales: Medical Importance and Route of Administration](#)

[Figure 11a – Domestic Sales: Medical Importance and Route of Administration](#)

[Table 11b – Percentages of Domestic Sales: Medical Importance and Route of Administration](#)

[Figure 11b – Percentages of Domestic Sales: Medical Importance and Route of Administration](#)

These tables and figures provide total annual domestic sales and distribution data of antimicrobial drugs approved for use in food-producing animals for multiple years in the same manner as described in Table 4 and Figure 4 (i.e., categorized by: (1) importance in human medical therapy [see Table 1 discussion on “medical importance”]; and (2) route of administration). They also provide data on the relative percentage of domestic sales and distribution data of medically

important antimicrobial drugs approved for use in food-producing animals for multiple years broken out by route of administration.

[Click here for narrative observations regarding multi-year trends \(2009-2014\): Domestic Sales - Medically important antimicrobials and route of administration](#)

[Click here for narrative observations regarding multi-year trends \(2009-2014\): Domestic Sales - Antimicrobials not currently medically important and route of administration](#)

[Table 12a – Domestic Sales: Medical Importance and Indications](#)

[Figure 12a – Domestic Sales: Medical Importance and Indications](#)

[Table 12b – Percentages of Domestic Sales: Medical Importance and Indications](#)

[Figure 12b – Percentages of Domestic Sales: Medical Importance and Indications](#)

These tables and figures provide total annual domestic sales and distribution data of antimicrobial drugs approved for use in food-producing animals for multiple years in the same manner as described in Table 5 and Figure 5 (i.e., categorized by: (1) importance in human medical therapy [see Table 1 discussion on “medical importance”]; and (2) approved label indications). They also provide data on the relative percentage of domestic sales and distribution data of medically important antimicrobial drugs approved for use in food-producing animals for multiple years broken out by approved label indications. Indications are either therapeutic (e.g., treatment, prevention, or control of disease) or for production (e.g., increased weight gain or improved feed efficiency). Please note that most products approved for production indications are also approved for therapeutic indications.

[Click here for narrative observations regarding multi-year trends \(2009-2014\): Domestic Sales - Medically important antimicrobials and indications](#)

[Click here for narrative observations regarding multi-year trends \(2009-2014\): Domestic Sales - Antimicrobials not currently medically important and indications](#)

[Table 13a – Domestic Sales: Medical Importance and Dispensing Status](#)

[Figure 13a – Domestic Sales: Medical Importance and Dispensing Status](#)

[Table 13b – Percentages of Domestic Sales: Medical Importance and Dispensing Status](#)

[Figure 13b – Percentages of Domestic Sales: Medical Importance and Dispensing Status](#)

These tables and figures provide total annual domestic sales and distribution data of antimicrobial

drugs approved for use in food-producing animals for multiple years in the same manner as described in Table 6 and Figure 6 (i.e., categorized by: (1) importance in human medical therapy [[see Table 1 discussion on “medical importance”](#)]; and (2) dispensing status (i.e., prescription, OTC, or VFD)). They also provide data on the relative percentage of domestic sales and distribution data of medically important antimicrobial drugs approved for use in food-producing animals for multiple years broken out by dispensing status. A prescription product requires a valid prescription order from a licensed veterinarian to be dispensed. An OTC product can be dispensed to anyone without an order from a veterinarian. Under 21 CFR 558.3(a)(6), a VFD drug is a drug provided through feed that requires a written statement from a veterinarian in the context of a valid veterinarian-client-patient relationship in order to be dispensed. Certain applications are approved with both a prescription and OTC dispensing status (Rx/OTC).

[Click here for narrative observations regarding multi-year trends \(2009-2014\): Domestic Sales - Antimicrobials not currently medically important and dispensing status](#)

[Table 14 – Domestic Sales: Medical Importance, Route of Administration, and Drug Class](#)

[Figure 14 – Domestic Sales: Medical Importance, Route of Administration, and Drug Class](#)

This table and figure provide total annual domestic sales and distribution data of antimicrobial drugs approved for use in food-producing animals for multiple years in the same manner as described in Table 7 and Figure 7 (i.e., categorized by: (1) importance in human medical therapy [[see Table 1 discussion on “medical importance”](#)]; (2) route of administration; and (3) antimicrobial drug class).

[Click here for narrative observations regarding multi-year trends \(2009-2014\): Domestic Sales - Medically important antimicrobials by route of administration and drug class](#)

[Click here for narrative observations regarding multi-year trends \(2009-2014\): Domestic Sales - Antimicrobials not currently medically important by route of administration and drug class](#)

VI. Sales and Distribution Observations

A. Current Reporting Year (2014)

In 2014, there were 20 sponsors of 150 actively marketed new animal drug applications for antimicrobials approved for use in food-producing animals ([Table 1](#), [Figure 1a](#), and [Figure 1b](#)).

In 2014, sales and distribution (domestic and export) of antimicrobials approved for use in

food-producing animals was approximately 15.4 million kilograms. Domestic sales and distribution of antimicrobials approved for use in food-producing animals was approximately 15.36 million kilograms (approximately 100%), and export sales and distribution was approximately 31 thousand kilograms (< 1%) ([Table 2](#) and [Figure 2](#)). Tetracyclines accounted for 43% and ionophores for 31% of domestic sales. Tetracyclines accounted for 22% of export sales.

1. Domestic sales and distribution of antimicrobials not currently medically important

In 2014, domestic sales and distribution of antimicrobials that are not currently medically important (NCMI) accounted for 38% of the domestic sales of all antimicrobials approved for use in food-producing animals; 80% of these were ionophores. Because of confidentiality constraints, sales and distribution data for other drug classes of NCMI antimicrobials approved for use in food-producing animals cannot be further reported ([Table 3](#) and [Figure 3](#)).

Because of confidentiality constraints, sales and distribution data for NCMI antimicrobials approved for use in food-producing animals cannot be further reported by route of administration ([Table 4](#) and [Figure 4](#)).

In 2014, domestic sales and distribution of NCMI antimicrobials that are approved for use in food-producing animals and are labeled solely for production indications accounted for 1% of the domestic sales of all NCMI antimicrobials approved for use in food-producing animals. In 2014, domestic sales and distribution of NCMI antimicrobials that are approved for use in food-producing animals and are labeled for both production and therapeutic indications accounted for 71% of the domestic sales of all NCMI antimicrobials approved for use in food-producing animals. Domestic sales and distribution of NCMI antimicrobials that are approved for use in food-producing animals and labeled solely for therapeutic indications accounted for 28% of domestic sales of all NCMI antimicrobials approved for use in food-producing animals ([Table 5](#) and [Figure 5](#)).

In 2014, domestic sales and distribution of NCMI antimicrobials that are approved for use in food-producing animals labeled with an OTC dispensing status accounted for 38% of the domestic sales of all antimicrobials for use in food-producing animals (100% of NCMI antimicrobials that are approved for use in food-producing animals). There are no NCMI antimicrobials that are approved for use in food-producing animals labeled with an Rx or VFD dispensing status ([Table 6](#) and [Figure 6](#)).

Because of confidentiality constraints, sales and distribution data for NCMI antimicrobials approved for use in food-producing animals cannot be broken out by route of administration and drug class ([Table 7](#) and [Figure 7](#)).

2. Domestic sales and distribution of medically important antimicrobials

In 2014, domestic sales and distribution of medically important antimicrobials accounted for 62% of the domestic sales of all antimicrobials approved for use in food-producing animals. Of these sales, tetracyclines accounted for 70%, penicillins for 9%, macrolides for 7%, sulfonamides (sulfas) for 5%, aminoglycosides for 3%, lincosamides for 2%,

fluoroquinolones for less than 1%, and cephalosporins for less than 1%. Because of confidentiality constraints, sales and distribution data for other drug classes of medically important antimicrobials approved for use in food-producing animals cannot be further reported ([Table 3](#) and [Figure 3](#)).

In 2014, domestic sales and distribution of medically important antimicrobials approved for use in food-producing animals administered in feed accounted for 74% of the domestic sales of all medically important antimicrobials for use in food-producing animals, while products administered by water accounted for 22%. Domestic sales and distribution of products administered by means of injection, intramammary, oral, and topical accounted for approximately 5% of the domestic sales of all medically important antimicrobials for use in food-producing animals ([Table 4](#) and [Figure 4](#)).

Because of confidentiality constraints, FDA cannot provide sales and distribution data for products labeled solely for production indications; therefore, products labeled for either production indications only or for both production and therapeutic indications are combined into a single category. In 2014, domestic sales and distribution of medically important antimicrobials that are approved for use in food-producing animals and are labeled solely for production indications or for both production and therapeutic indications accounted for 72% of the domestic sales of all medically important antimicrobials approved for use in food-producing animals. In 2014, domestic sales and distribution of medically important antimicrobials that are approved for use in food-producing animals and are labeled solely for therapeutic indications accounted for 28% of the domestic sales of all medically important antimicrobials approved for use in food-producing animals ([Table 5](#) and [Figure 5](#)).

In 2014, domestic sales and distribution of medically important antimicrobials approved for use in food-producing animals labeled with solely an OTC dispensing status accounted for 97% of the domestic sales of all medically important antimicrobials for use in food-producing animals. In 2014, domestic sales and distribution of medically important antimicrobials approved for use in food-producing animals labeled with an Rx, Rx/OTC, or VFD dispensing status accounted for approximately 3% of the domestic sales of all medically important antimicrobials for use in food-producing animals ([Table 6](#) and [Figure 6](#)).

In 2014, tetracyclines administered by feed accounted for 61% of domestic sales and distribution of medically important antimicrobials approved for use in food-producing animals, sulfas for 1%, and all other medically important antimicrobials for 11%. In 2014, tetracyclines administered by water accounted for 8% of domestic sales and distribution of medically important antimicrobials approved for use in food-producing animals, penicillins for 8%, sulfas for 3%, aminoglycosides for 2%, and lincosamides for 1%. Because of confidentiality constraints, FDA cannot provide sales and distribution data separately for medically important antimicrobial drug products broken out by other routes of administration and drug class ([Table 7](#) and [Figure 7](#)).

B. Multi-Year Trends (2009-2014)

This 2014 summary report includes multiple years of domestic sales and distribution data of actively marketed antimicrobial drugs, as well as observations on the changes in the sales and

distribution of the subject drugs for the period from 2009 through 2014, and from 2013 through 2014.

From 2009 through 2014, the number of animal drug sponsors of actively marketed new animal drug applications for antimicrobials approved for use in food-producing animals declined from 25 to 20. The number of actively marketed new animal drug applications for antimicrobials approved for use in food-producing animals declined from 157 to 150 ([Figure 8a](#) and [Figure 8b](#)).

From 2009 through 2014, sales and distribution (domestic and export) of antimicrobials approved for use in food-producing animals increased by 20%, and increased by 4% from 2013 through 2014. From 2009 through 2014, domestic sales and distribution of antimicrobials approved for use in food-producing animals increased by 22%, and increased by 4% from 2013 through 2014 ([Table 9](#) and [Figure 9](#)). From 2009 through 2014, export sales and distribution of antimicrobials approved for use in food-producing animals decreased by 85%, and decreased by 59% from 2013 through 2014; however, it should be noted that export sales are a small fraction (0.2% for 2014) of the total sales of such antimicrobials ([Table 9](#) and [Figure 9](#)). Because of confidentiality constraints, export sales and distribution data for antimicrobials approved for use in food-producing animals cannot be further reported.

1. Domestic sales and distribution of antimicrobials not currently medically important

From 2009 through 2014, domestic sales and distribution of antimicrobials approved for use in food-producing animals that are not currently medically important (NCMI) increased by 20%, and increased 5% from 2013 through 2014. The increase of 20% from 2009 through 2014 reflects a 26% increase in sales and distribution of ionophores. Because of confidentiality constraints, FDA cannot provide sales and distribution data separately for NCMI antimicrobial drug products broken out by other drug classes ([Table 10](#) and [Figure 10](#)).

Because of confidentiality constraints, sales and distribution data for NCMI antimicrobials approved for use in food-producing animals cannot be further reported by route of administration ([Table 11a](#) and [Figure 11a](#)).

Because of confidentiality constraints, FDA cannot provide sales and distribution data for products labeled solely for production indications; therefore, products labeled for either production indications only or for both production and therapeutic indications are combined into a single category. From 2009 through 2014, the percentage of domestic sales and distribution of NCMI antimicrobials that are approved for use in food-producing animals and are labeled solely for production indications or for both production and therapeutic indications increased by 20%, and increased by 9% from 2013 through 2014. From 2009 through 2014, the percentage of domestic sales and distribution of NCMI antimicrobials that are approved for use in food-producing animals and are labeled solely for therapeutic indications increased by 21%, but decreased by 4% from 2013 through 2014 ([Table 12a](#) and [Figure 12a](#)).

From 2009 through 2014, the percentage of domestic sales and distribution of NCMI that are approved for use in food-producing animals labeled with an OTC dispensing status increased by 20%, and increased by 5% from 2013 through 2014. There are no NCMI

antimicrobials that are approved for use in food-producing animals labeled with an Rx or VFD dispensing status ([Table 13a](#) and [Figure 13a](#)).

Because of confidentiality constraints, sales and distribution data for NCMI antimicrobials approved for use in food-producing animals cannot be broken out by route of administration and drug class ([Table 14](#) and [Figure 14](#)).

2. Domestic sales and distribution of medically important antimicrobials

From 2009 through 2014, domestic sales and distribution of medically important antimicrobials approved for use in food-producing animals increased by 23%, and increased by 3% from 2013 through 2014 ([Table 10](#) and [Figure 10](#)). From 2009 through 2014, domestic sales and distribution of medically important antimicrobials administered by water increased from 19% to 22% of the domestic sales of all medically important antimicrobials approved for use in food-producing animals, while sales of products administered by feed remained unchanged at 74% ([Table 11b](#) and [Figure 11b](#)). Also during this same period, domestic sales of medically important antimicrobials labeled solely for therapeutic indications remained unchanged at 28% of the domestic sales of all medically important antimicrobials approved for use in food-producing animals ([Table 12b](#) and [Figure 12b](#)).

Domestic sales and distribution of medically important antimicrobials by route of administration and drug class¹

From 2009 through 2014, domestic sales and distribution of tetracycline products approved for use in food-producing animals increased by 25%, and increased by 1% from 2013 through 2014 ([Table 10](#) and [Figure 10](#)). The increase of 25% from 2009 through 2014 reflects a 26% increase in sales and distribution of tetracyclines administered by feed, a 24% increase for tetracyclines administered by water, and a 13% decrease for tetracyclines administered by other routes ([Table 14](#) and [Figure 14](#)). During the same period, the number of actively marketed tetracycline products for use in food-producing animals decreased from 41 to 37 ([Figure 8a](#)), and the number of unique sponsors of these products decreased from 13 to 8 ([Figure 8b](#)).

From 2009 through 2014, domestic sales and distribution of penicillin products approved for use in food-producing animals increased by 28%, and increased by 7% from 2013 through 2014 ([Table 10](#) and [Figure 10](#)). The increase of 28% from 2009 through 2014 reflects a 65% increase in sales and distribution of penicillins administered by water ([Table 14](#) and [Figure 14](#)). Changes in sales and distribution of penicillin products administered by other routes cannot be reported because of confidentiality constraints. During the same period, the number of actively marketed penicillin products for use in food-producing animals decreased from 23 to 21 ([Figure 8a](#)), and the number of unique drug sponsors of these products decreased from 11 to 8 ([Figure 8b](#)).

From 2009 through 2014, domestic sales and distribution of macrolide products approved

¹ With the exception of aminoglycosides, all classes of antimicrobials discussed in this section include antimicrobial drug applications which are approved and labeled for use in both food-producing animals (e.g., cattle and swine) and nonfood-producing animals (e.g., dogs and cats).

for use in food-producing animals increased by 11%, and increased by 10% from 2013 through 2014 ([Table 10](#) and [Figure 10](#)). The overall increase in sales and distribution of macrolides of 11% from 2009 through 2014 cannot be further reported by routes of administration because of confidentiality constraints ([Table 14](#) and [Figure 14](#)). During the same period, the number of actively marketed macrolide products for use in food-producing animals increased from 10 to 16 ([Figure 8a](#)), and the number of unique drug sponsors of these products increased from 5 to 7 ([Figure 8b](#)).

From 2009 through 2014, domestic sales and distribution of sulfa products approved for use in food-producing animals decreased by 11%, and increased by 18% from 2013 through 2014 ([Table 10](#) and [Figure 10](#)). The decrease of 11% from 2009 through 2014 reflects a 9% decrease in sales and distribution of sulfas administered by feed, and a 10% decrease by water ([Table 14](#) and [Figure 14](#)). During the same period, the number of actively marketed sulfa products for use in food-producing animals decreased from 27 to 21 ([Figure 8a](#)), and the number of unique drug sponsors of these products decreased from 11 to 9 ([Figure 8b](#)).

From 2009 through 2014, domestic sales and distribution of aminoglycoside products approved for use in food-producing animals increased by 36%, and increased by 14% from 2013 through 2014 ([Table 10](#) and [Figure 10](#)). The increase of 34% from 2009 through 2014 reflects a 41% increase in sales and distribution of aminoglycosides administered by water ([Table 14](#) and [Figure 14](#)). Changes in sales and distribution of aminoglycoside products administered by other routes cannot be reported because of confidentiality constraints. During the same period, the number of actively marketed aminoglycoside products for use in food-producing animals decreased from 22 to 20 ([Figure 8a](#)), and the number of unique drug sponsors of these products decreased from 12 to 10 ([Figure 8b](#)).

From 2009 through 2014, domestic sales and distribution of lincosamide products approved for use in food-producing animals increased by 150%, and decreased 1% from 2013 through 2014 ([Table 9](#) and [Figure 9](#)). The increase of 150% from 2009 through 2014 reflects a 300% increase in sales and distribution of lincosamides administered by water ([Table 14](#) and [Figure 14](#)). Changes in sales and distribution of lincosamide products administered by other routes cannot be reported because of confidentiality constraints. During the same period, the number of actively marketed lincosamide products for use in food-producing animals decreased from 15 to 12 ([Figure 8a](#)), and the number of unique drug sponsors of these products decreased from 7 to 5 ([Figure 8b](#)).

From 2009 through 2014, domestic sales and distribution of cephalosporin products approved for use in food-producing animals increased by 57%, and increased by 12% from 2013 through 2014 ([Table 10](#) and [Figure 10](#)). The overall increase in sales and distribution of cephalosporins of 57% from 2009 through 2014, and increase of 12% from 2013 through 2014, cannot be further reported by routes of administration because of confidentiality constraints ([Table 14](#) and [Figure 14](#)). From 2009 through 2012, the number of actively marketed cephalosporin products for use in food-producing animals decreased from 10 to 9, and returned to 10 in 2013 and 2014 ([Figure 8a](#)). From 2009 through 2014, the number of unique drug sponsors remained the same at 3 ([Figure 8b](#)).

Domestic sales and distribution of medically important antimicrobials by route of administration

Because of confidentiality constraints, FDA cannot provide sales and distribution data separately for products administered orally and topically; therefore, products approved for oral or topical means of administration have been combined into a single category. From 2009 through 2014, the percentage of domestic sales and distribution of medically important antimicrobials approved for use in food-producing animals administered by water increased from 19% to 22%, while products administered by feed remained unchanged at 74%. During the same period the percentage of domestic sales and distribution of products administered by means of injection decreased from 5% to 4%, those administered orally or topically decreased from 2% to 1%, and those administered by means of intramammary remained unchanged at less than 1% ([Table 11b](#) and [Figure 11b](#)).

Domestic sales and distribution of medically important antimicrobials by indication

Because of confidentiality constraints, FDA cannot provide sales and distribution data for products labeled solely for production indications; therefore, products labeled for either production indications only or for both production and therapeutic indications are combined into a single category. From 2009 through 2014, the percentage of domestic sales and distribution of medically important antimicrobials approved for use in food-producing animals labeled solely for production indications or for both production and therapeutic indication remained unchanged at 72%. During the same period, the percentage of domestic sales and distribution of medically important antimicrobials approved for use in food-producing animals labeled solely for therapeutic indications remained unchanged at 28% ([Table 12b](#) and [Figure 12b](#)).

Domestic sales and distribution of medically important antimicrobials by dispensing status

Because of confidentiality constraints, FDA cannot provide sales and distribution data for products labeled with a VFD dispensing status; therefore, products labeled with either a VFD dispensing status or Rx dispensing status are combined into a single category. The summary report does provide sales and distribution data for products approved with an OTC dispensing status. From 2009 through 2014, the percentage of domestic sales and distribution of medically important antimicrobials approved for use in food-producing animals labeled solely with an OTC dispensing status decreased from approximately 98% to 97% ([Table 13b](#) and [Figure 13b](#)).

	Indications	Annual Totals (kg)²	% Subtotal	% Grand Total
<u>Medically Important</u> ³	<i>Production⁵ or Production/Therapeutic⁶ Indications^{1,7}</i>	6,787,646	72%	44%
	<i>Therapeutic Indications Only^{1,6}</i>	2,688,343	28%	18%
	<i>Subtotal</i>	9,475,989	100%	62%
<u>Not Currently Medically Important</u> ⁴	<i>Production Indications Only⁵</i>	84,168	1%	<1%
	<i>Production/Therapeutic⁶ Indications</i>	4,174,980	71%	27%
	<i>Therapeutic Indications Only⁶</i>	1,623,073	28%	11%
	<i>Subtotal</i>	5,882,221	100%	38%
	<i>Grand Total</i>	15,358,210		100%

¹ Includes antimicrobial drug applications which are approved and labeled for use in both food-producing animals (e.g., cattle and swine) and nonfood-producing animals (e.g., dogs and cats).

² kg = kilogram of active ingredient. Antimicrobials which were reported in International Units (IU) (e.g., Penicillins) were converted to kg. Antimicrobial class includes drugs of different molecular weights, with some drugs reported in different salt forms.

³ Guidance for Industry #213 states that all antimicrobial drugs and their associated classes listed in Appendix A of FDA's Guidance for Industry #152 are considered "medically important" in human medical therapy.

⁴ Not Currently Medically Important refers to any antimicrobial class not currently listed in Appendix A of FDA's Guidance for Industry #152.

⁵ Production Indications (e.g., increased rate of weight gain or improved feed efficiency). Guidance for Industry #213 states that FDA believes that production use indications such as "increased rate of weight gain" or "improved feed efficiency" are no longer appropriate for the approved conditions of use for medically important antimicrobial drugs. It also states that FDA will be working with affected drug sponsors who wish to voluntarily withdraw approved production uses of their medically important antimicrobial new animal drugs and combination new animal drug products.

⁶ Therapeutic Indications (e.g., treatment, control, or prevention of a specific disease).

⁷ There were fewer than three distinct sponsors marketing medically important antimicrobial animal drugs with only production indications (i.e., with no therapeutic indications). To protect confidential business information these data cannot be independently reported and are, therefore, combined with the data for drugs with both production and therapeutic (production/therapeutic) indications.

¹ Includes antimicrobial drug applications which are approved and labeled for use in both food-producing animals (e.g., cattle and swine) and nonfood-producing animals (e.g., dogs and cats).

² kg = kilogram of active ingredient. Antimicrobials which were reported in International Units (IU) (e.g., Penicillins) were converted to kg. Antimicrobial class includes drugs of different molecular weights, with some drugs reported in different salt forms.

³ Guidance for Industry #213 states that all antimicrobial drugs and their associated classes listed in Appendix A of FDA's Guidance for Industry #152 are considered "medically important" in human medical therapy.

⁴ Not Currently Medically Important refers to any antimicrobial class not currently listed in Appendix A of FDA's Guidance for Industry #152.

⁵ NIR = Not Independently Reported. Antimicrobial classes for which there were fewer than three distinct sponsors actively marketing products domestically are not independently reported. These classes include the following: Amphenicols, Diaminopyrimidines, Fluoroquinolones, Polymyxins (excluding 2012 and 2013), and Streptogramins.

⁶ NIR = Not Independently Reported. Antimicrobial classes for which there were fewer than three distinct sponsors are not independently reported. These classes include the following: Aminocoumarins, Glycolipids, Pleuromutilins, Polypeptides, and Quinoxalines.

¹ Includes antimicrobial drug applications which are approved and labeled for use in both food-producing animals (e.g., cattle and swine) and nonfood-producing animals (e.g., dogs and cats).

² kg = kilogram of active ingredient. Antimicrobials which were reported in International Units (IU) (e.g., Penicillins) were converted to kg. Antimicrobial class includes drugs of different molecular weights, with some drugs reported in different salt forms.

³ Guidance for Industry #213 states that all antimicrobial drugs and their associated classes listed in Appendix A of FDA’s Guidance for Industry #152 are considered “medically important” in human medical therapy.

⁴ Not Currently Medically Important refers to any antimicrobial class not currently listed in Appendix A of FDA’s Guidance for Industry #152.

⁵ This category includes the following: Injection, Intramammary, Oral (excluding administration by means of feed or water), and Topical (excluding 2012 and 2013).

⁶ This category includes the following: Feed, Intramammary, and Water.

⁷ This category includes the following: Aminoglycosides, Amphenicols, Diaminopyrimidines, Lincosamides, Macrolides, Penicillins, and Streptogramins.

⁸ This category includes the following: Amphenicols (excluding 2013) and Macrolides.

⁹ This category includes the following: Aminoglycosides, Amphenicols, Fluoroquinolones, Lincosamides, Macrolides, Penicillins, and Polymyxins (excluding 2012 and 2013).

¹⁰ This category includes the following: Aminocoumarins, Glycolipids, Ionophores, Pleuromutilins, Polypeptides, and Quinoxalines.
