

ENVIRONMENTAL ASSESSMENT
FOOD CONTACT NOTIFICATION
Dover Chemical Corporation

1. **Date:** January 23, 2017
2. **Name of Applicant/Notifier:** Dover Chemical Corporation
3. **Address:** 3676 Davis Road, NW
Dover, Ohio 44622

All communications on this matter are to be sent in care of Counsel for Notifier:
Devon Wm. Hill, Partner
Keller and Heckman LLP

Washington, D.C. 20001
Telephone: (202) 434-4279
Facsimile: (202) 434-4646
E-mail: hill@khlaw.com

4. Description of the Proposed Action

The action identified in this food-contact notification (FCN) is to provide for the use of the food-contact substance (FCS), phosphorous acid, triphenyl ester, polymer with α -hydro- ω -hydroxypoly[oxy(methyl-1,2-ethanediyl)]-, C10-16 alkyl esters (CAS Reg. No. 1227937-46-3), for use as a thermal stabilizer at levels up to 0.20% in the manufacture of linear low density polyethylene (LLDPE), high density polyethylene (HDPE), polypropylene (PP), and high impact polystyrene (HIPS) copolymer food-contact articles that will contact all food types under FDA's Conditions of Use A ("High temperature heat-sterilized (*e.g.*, over 212°F)") through H ("Frozen or refrigerated storage: Ready-prepared foods intended to be reheated in container at time of use"). The FCS is not for use in contact with infant formula and breast milk because such uses were not included as part of the intended use of the substance in the FCN. The FCS may be used in conjunction with triisopropanolamine (CAS Reg. No. 122-20-3) at a maximum use level of 1.5% by weight of the FCS.

The FCS is meant to act as a thermal stabilizer for the resins to which it is added. The Notifier does not intend to produce finished food packaging, as the FCS is an additive that is used in the manufacture of resins used for food-contact applications. Resins containing the FCS will then be sold to manufacturers engaged in the production of food-contact articles. Food-contact articles produced with resins containing the FCS will be utilized in patterns corresponding to the national population density and will be widely distributed across the country. Therefore, it is anticipated that disposal of resins containing the FCS will occur nationwide. It is estimated that, of the plastic containers and packaging present in municipal

solid waste (MSW) generated in 2014, approximately 68.5% generally was land disposed, 16.7% was combusted, and 14.86% was recovered for recycling.¹

5. Identification of Substance that is the Subject of the Proposed Action

The FCS that is the subject of this notification is phosphorous acid, triphenyl ester, polymer with α -hydro- ω -hydroxypoly[oxy(methyl-1,2-ethanediyl)]-, C10-16 alkyl esters (CAS Reg. No. 1227937-46-3). The product is marketed under the trade name LGP-11.

6. Introduction of Substances into the Environment

Under 21 C.F.R. § 25.40(a), an environmental assessment ordinarily should focus on relevant environmental issues relating to the use and disposal from use, rather than the production, of FDA-regulated articles. Moreover, information available to the Notifier does not suggest that there are any extraordinary circumstances in this case indicative of any adverse environmental impact as a result of the manufacture of the FCS. Consequently, information on the manufacturing site and compliance with relevant emissions requirements is not provided here.

No environmental release is expected upon the use of the subject FCS to fabricate packaging materials. In these applications, the FCS (*i.e.*, an additive for polymers) is expected to be entirely incorporated into the finished food-contact article. Any waste materials generated in this process, *e.g.*, plant scraps, are expected to be disposed of as a part of the food-contact article manufacturer's overall nonhazardous solid waste in accordance with established procedures.

The subject FCS consists of the elements carbon, hydrogen, and phosphorus. Thus, carbon dioxide is expected to form upon combustion of the FCS. Based on the elemental composition of the FCS, the worst-case releases of carbon dioxide from the FCS has been calculated in a confidential appendix to the Environmental Assessment and an assessment of these worst-case releases is also included in the same confidential appendix.

On August 1, 2016, the Council on Environmental Quality (CEQ) issued final guidance² to agencies regarding addressing GHG emissions and climate change impacts in NEPA documents. This guidance is "intended to help Federal agencies ensure their analysis of potential

¹ *Advancing Sustainable Materials Management: 2014 Fact Sheet, Assessing Trends in Material Generation, Recycling and Disposal in the United States*, U.S. Environmental Protection Agency, Solid Waste and Emergency Response, November 2016. See https://www.epa.gov/sites/production/files/2016-11/documents/2014_smmfactsheet_508.pdf. According to Table 8 of this report, of plastic containers and packaging comprising MSW in 2014, approximately 68.5% was land disposed, 16.7% was combusted, and 14.8% was recovered for recycling.

² Council on Environmental Quality (CEQ), Final Guidance for Federal Departments and Agencies on Consideration of Climate Change in National Environmental Policy Act Reviews, August 1, 2016, *available at*: https://www.whitehouse.gov/sites/whitehouse.gov/files/documents/nepa_final_ghg_guidance.pdf

GHG emissions and effects of climate change in an EA or EIS is commensurate with the extent of the effects of the proposed action” (CEQ, 2016 p. 3). The GHG emissions resulting from the use and disposal of the FCS relate to the incineration of articles containing the FCS in municipal solid waste (MSW) combustion facilities. Such facilities are regulated by the U.S. Environmental Protection Agency (U.S. EPA) under 40 C.F.R. Part 98, which “establishes mandatory GHG reporting requirements for owners and operators of certain facilities that directly emit GHG.” Section 2 of this regulation (40 C.F.R. § 98.2), describes the facilities that must report GHG emissions and sets an annual 25,000 metric ton carbon dioxide equivalents (CO₂-e) emission threshold for required reporting.

To evaluate the significance of the environmental impact of these GHG emissions, we refer to CEQ regulations in 40 C.F.R. § 1508.27, which define ‘significantly’ as it relates to assessing the intensity of an environmental impact in NEPA documents. Moreover, 40 C.F.R. § 1508.27(b)(10) states that when evaluating intensity of an impact, one should consider “whether the action threatens a violation of Federal, State, or local law or requirements imposed for the protection of the environment.” GHG emissions from MSW combustion facilities are regulated under 40 C.F.R. § 98.2. Based on the confidential market volume, the expected carbon dioxide equivalent emissions, as shown in the confidential appendix to the EA, are below 25,000 metric tons on an annual basis. As the estimated GHG emissions are well below the threshold for mandatory reporting, no significant environmental impacts are anticipated resulting from combustion of the FCS in MSW combustion facilities.

Only extremely small amounts, if any, of the FCS constituents are expected to enter the environment as a result of the landfill disposal of food-contact articles, in light of the Environmental Protection Agency’s (EPA) regulations governing municipal solid waste landfills. EPA’s regulations require new municipal solid-waste landfill units and lateral expansions of existing units to have composite liners and leachate collection systems to prevent leachate from entering ground and surface water, and to have groundwater monitoring systems.³ Although owners and operators of existing active municipal solid waste landfills that were constructed before October 9, 1993 are not required to retrofit liners and leachate collections systems, they are required to monitor groundwater and to take corrective action as appropriate.

7. Fate of Emitted Substances in the Environment

No significant effect on the concentrations of and exposures to any substances in the atmosphere are anticipated due to the proposed use of the subject FCS as a result of the use of the FCS as a thermal stabilizer. The FCS is a polymeric material and does not readily volatilize during use of the FCS, and the analysis discussed above in Item number 6 demonstrates that no significant environmental impacts are anticipated resulting from combustion of the FCS in MSW combustion facilities. Thus, no significant quantities of any substances will be released upon the use and disposal of food-contact articles manufactured with this FCS.

No significant effects on the concentrations of and exposures to any substances in fresh water, estuarine, or marine ecosystems are anticipated due to the proposed use of the subject

³ 40 C.F.R. Part 258.

FCS. No significant quantities of any substance will be added to these water systems upon the proper incineration of the FCS, nor upon its disposal in landfills.

Considering the factors discussed above, no significant effects on the concentrations of and exposures to any substances in terrestrial ecosystems are anticipated as a result of the proposed use of the subject FCS. Furthermore, the use of the FCS as a thermal stabilizer is a replacement for other phosphite stabilizers already on the market for use in food-contact applications and precludes any substantial increase in release to the environment of its components; examples of other phosphite stabilizers already permitted for use in the same polymers proposed in this Notification are those cleared by 21 C.F.R. § 178.2010 (“Antioxidants and/or stabilizers for polymers”) and FCN Nos. 20, 21, 22, 232, 337, 626, 861, 895, 960, 1230, 1282, 1544, and 1604. Thus, there is no expectation of any meaningful exposure of terrestrial organisms to these substances as a result of the proposed use of the FCS.

Considering the foregoing, we respectfully submit that there is no reasonable expectation of a significant impact on the concentration of any substance in the environment due to the proposed use of the subject FCS in the manufacture of articles intended for use in contact with food.

8. Environmental Effects of Released Substances

No information is needed to address the environmental effects of substances released into the environment as a result of the use and disposal of the subject substance in landfills and by combustion because, as discussed under Item 6 above, only very small quantities of substances, if any, are expected to be introduced into the environment due to the intended use of the FCS. The use and disposal of the subject substance in landfills or by combustion are not expected to threaten a violation of applicable laws and regulation, *e.g.*, the Environmental Protection Agency’s regulations in 40 C.F.R. Part 60 (“Standards of performance for new stationary sources”) that pertain to municipal solid waste combustors and Part 258 that pertain to landfills.

9. Use of Resources and Energy

As is the case with other food-contact materials, the production, use, and disposal of the FCS involve the use of natural resources such as petroleum products, coal, and the like. However, the use of the subject FCS in the fabrication of food-contact materials is not expected to result in a net increase in the use of energy and resources because the FCS is intended to be used in food-contact resins in place of similar phosphite thermal stabilizers now on the market for use in food-contact applications.

The replacement of other thermal stabilizers by the subject FCS in food-contact resins is not expected to have any adverse impact on the use of energy and resources. Manufacture of the FCS, its use in resins, and the final conversion to finished food-contact articles will consume energy and resources in amounts comparable to the manufacture and use of the thermal stabilizers. Packaging materials produced from resins containing the FCS are expected to be disposed of according to the same patterns when they it is used in place of current materials. Thus, there will be no impact on current or future recycling programs.

10. Mitigation Measures

As shown above, no significant adverse environmental impacts are expected to result from the use and disposal of food-contact materials fabricated from resins containing the FCS. Thus, the use of the FCS as proposed is not reasonably expected to result in any new environmental problem requiring mitigation measures of any kind.

11. Alternatives to the Proposed Action

No potential adverse environmental effects are identified herein that would necessitate alternative actions to those proposed in this Notification. The alternative of not approving the action proposed herein would simply result in the continued use of the materials that the subject FCS would otherwise replace; such action would have no environmental impact.

12. List of Preparers

Lester Borodinsky, Ph.D. in Chemistry, 31 years of experience performing evaluations relating to all aspects of Food Additive Petitions and Food Contact Notifications, Staff Scientist, Keller and Heckman LLP, 1001 G Street, NW, Suite 500 West, Washington, D.C. 20001.
