# Sunitinib Malate (SUTENT®)

***Sriram Krishnaswami, Ph.D.***
*Asset Team Leader Oncology*
*Pfizer Inc*

*Oncologic Drugs Advisory Committee Meeting*
*September 19, 2017*
*FDA White Oak Campus*
*Silver Spring, MD*

# Proposed Indication and Dosing Regimen

- Indication
  - SUTENT is indicated for the adjuvant treatment of adult patients at high risk of recurrent renal cell carcinoma (RCC) following nephrectomy
- Dosing Regimen
  - 50 mg taken orally once daily, on Schedule 4/2 (4 weeks on treatment, 2 weeks off)

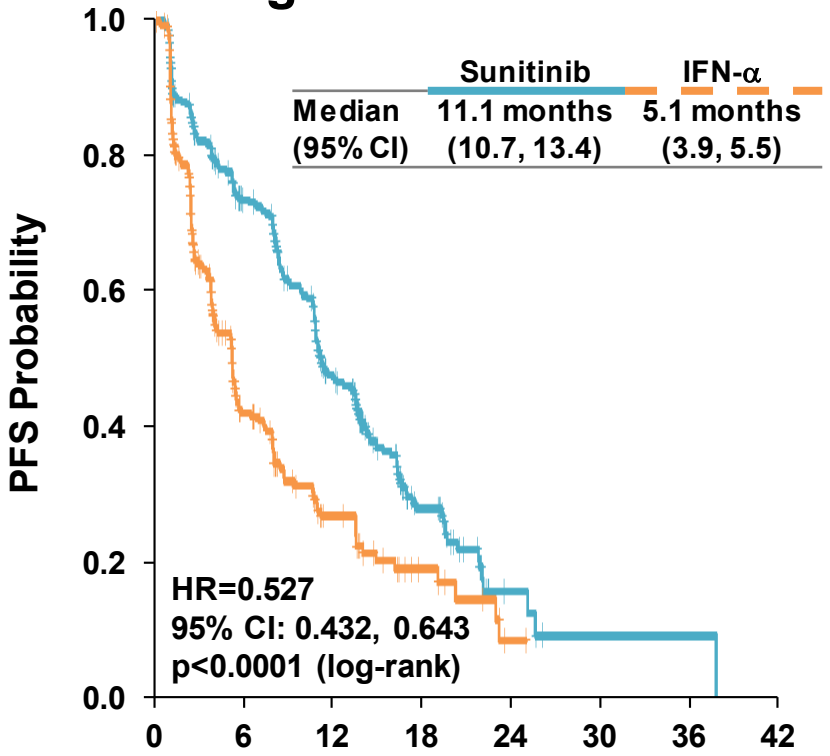
mg=milligrams

# SUTENT (sunitinib malate) Background

- Small molecule, anti-angiogenic multi-targeted tyrosine kinase inhibitor
- Approved in the United States in 2006
- Studied in >7000 patients in clinical trials
- >350,000 patients treated globally
- Approved indications
  - Gastrointestinal stromal tumor (GIST) after disease progression on or intolerance to imatinib mesylate
  - Advanced renal cell carcinoma (RCC)
  - Progressive, well-differentiated pancreatic neuroendocrine tumors (pNET) in patients with unresectable locally advanced or metastatic disease
- Dosing
  - RCC and GIST: 50 mg daily on Schedule 4/2
  - pNET: 37.5 mg continuous daily dosing

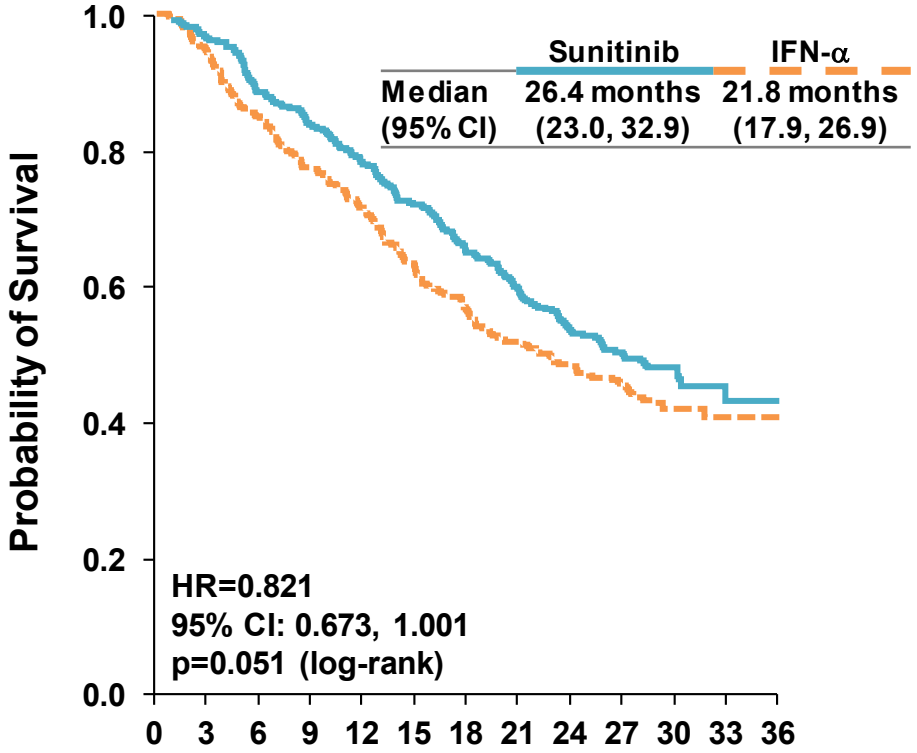
# Proven Efficacy in Metastatic RCC
# Study 1034: Sunitinib vs. IFN-α

## Progression-Free Survival



| No. at Risk | | | | | | | | |
|---|---|---|---|---|---|---|---|---|
| Sunitinib | 375 | 224 | 119 | 34 | 5 | 1 | 1 | 0 |
| IFN-α | 375 | 80 | 32 | 10 | 1 | 0 | 0 | 0 |

## Overall Survival



| No. at Risk | | | | | | | | |
|---|---|---|---|---|---|---|---|---|
| Sunitinib | 375 | 326 | 283 | 229 | 180 | 61 | 2 | |
| IFN-α | 375 | 295 | 242 | 187 | 149 | 53 | 1 | |

ASCO=American Society of Clinical Oncology; CI=Confidence Interval; HR=Hazard Ratio; IFN-α=Interferon alpha; No.=Number; PFS=Progression-Free Survival

# Why Sunitinib as an Adjuvant Treatment?

**Unmet Need**

- High-risk patients have a 60% risk of recurrence following nephrectomy and no available treatment options

**Efficacy**

- 24% relative DFS event risk reduction overall and 8% absolute DFS improvement at 5 years

**Safety**

- Adverse events are predictable, manageable and reversible

**Benefit/Risk**

- Favorable for patients at high risk of recurrence

DFS=Disease-Free Survival

# Non-Metastatic RCC: Unmet Medical Need

***Allan Pantuck, M.D.***

*Professor of Urology*

*UCLA Medical Center, Los Angeles, CA*

# Why Sunitinib as an Adjuvant Treatment?

**Unmet Need**

- High-risk patients have a 60% risk of recurrence following nephrectomy and no available treatment options

**Efficacy**

- 24% relative DFS event risk reduction overall and 8% absolute DFS improvement at 5 years

**Safety**

- Adverse events are predictable, manageable and reversible

**Benefit/Risk**

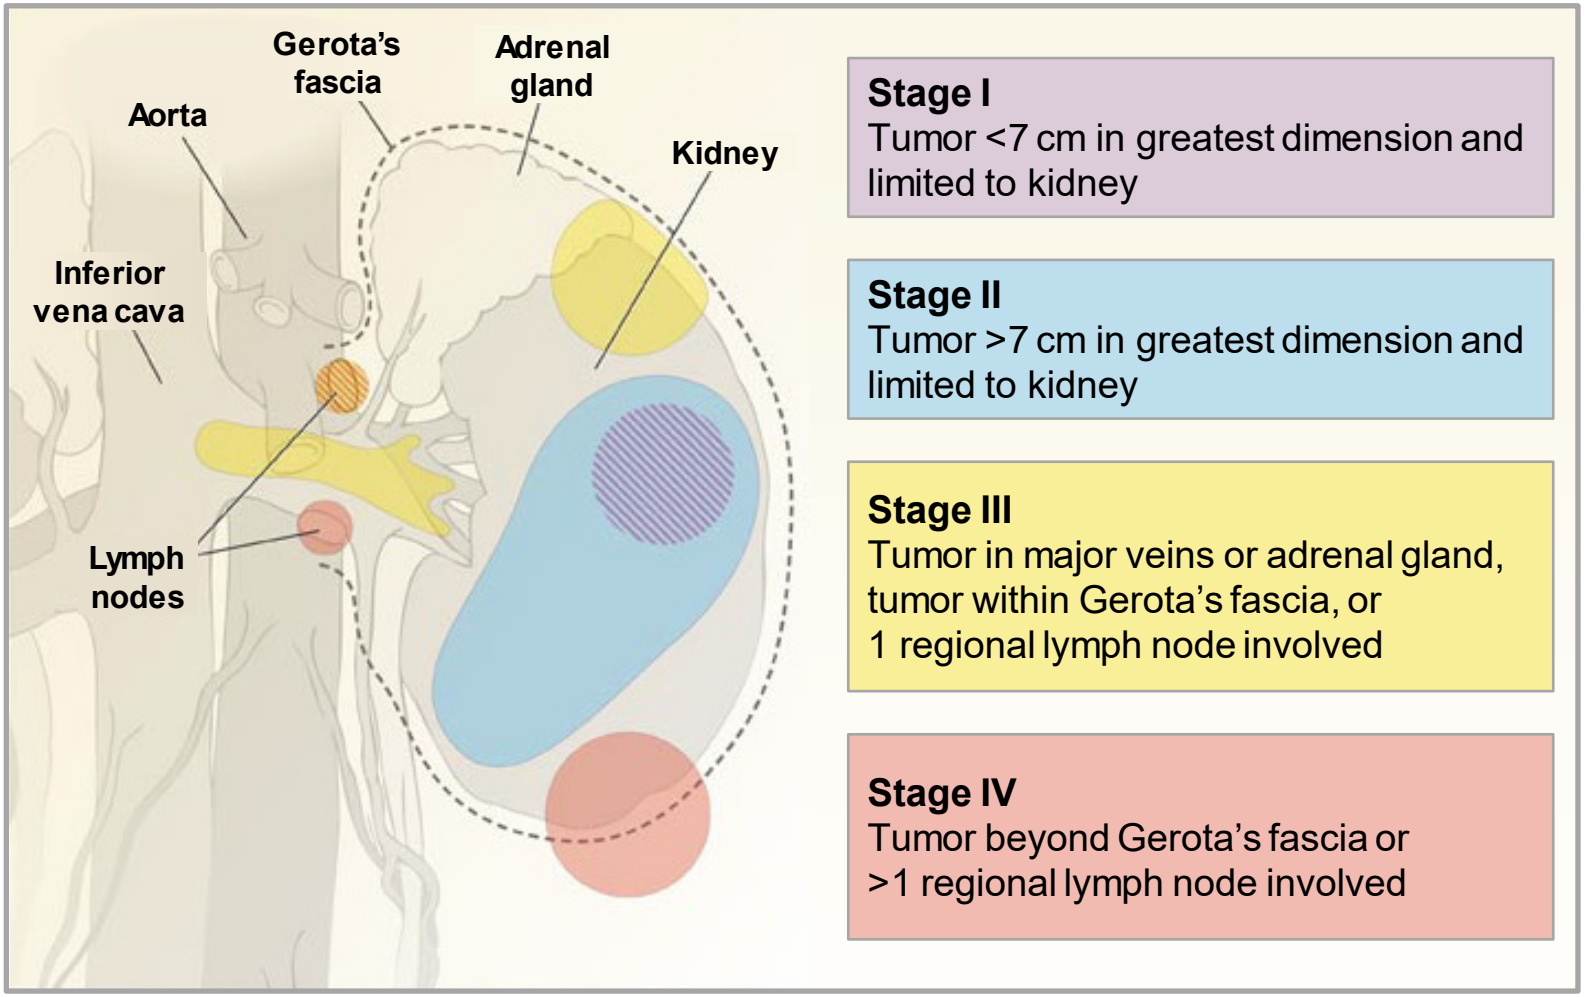
- Favorable for patients at high risk of recurrence

# Epidemiology

- US RCC incidence and death
  - 64,000 newly diagnosed and 14,000 deaths annually
- Surgical resection followed by observation is the standard of care
- Relapse rate after surgery remains high for sizable subset of patients
- Metastatic RCC (mRCC) remains a largely incurable disease with a 5-year survival rate as low as 12%

SEER Cancer Statistics Factsheets: Kidney and Renal Pelvis Cancer. 2016.

# Renal Cell Carcinoma Staging



**Stage I**
Tumor <7 cm in greatest dimension and limited to kidney

**Stage II**
Tumor >7 cm in greatest dimension and limited to kidney

**Stage III**
Tumor in major veins or adrenal gland, tumor within Gerota's fascia, or 1 regional lymph node involved

**Stage IV**
Tumor beyond Gerota's fascia or >1 regional lymph node involved

Adapted from Figure 1: Cohen et al. *NEJM* 2005;353:2477-90.
cm=centimeters

# Renal Cell Carcinoma Staging

# Renal Cell Carcinoma Distribution and 5-Year Recurrence Rates by UISS Risk Group

| UISS Risk Group | Proportion of Patients % | 5-Year Recurrence Rate % |
|---|---|---|
| Low | 37.8 | 9.6 |
| Intermediate | 48.4 | 38.2 |
| High | 13.9 | 58.1 |

Lam et al. *J. Urol* 2005;174:466-472.

# Who Are My Patients?

## PATIENT

- 57 years old
- Male
- Active
- Busy work, family and social life

## DISEASE and TREATMENT

### Diagnosis

Presented to PCP with pain. Abdominal CT scan revealed primary tumor in his right kidney

| | |
|---|---|
| **Comorbidities** | Diabetes, controlled with antidiabetes medication<br>hypertension, controlled with antihypertensives |
| **Surgery** | Radical nephrectomy |
| **Pathology Report** | Tumor<br>• Size: 12x6x6 cm<br>• Directly invades perinephric fat but does not extend beyond Gerota fascia<br>• Type: clear cell<br>• Lymph nodes, regional<br>  • Number examined: 5<br>  • Number positive: 0 |

## RISK of RECURRENCE

**TNM Staging: T3a, N0, M0**

**Fuhrman Grade: 3**

**ECOG Performance Status: 1**

**HIGH RISK**

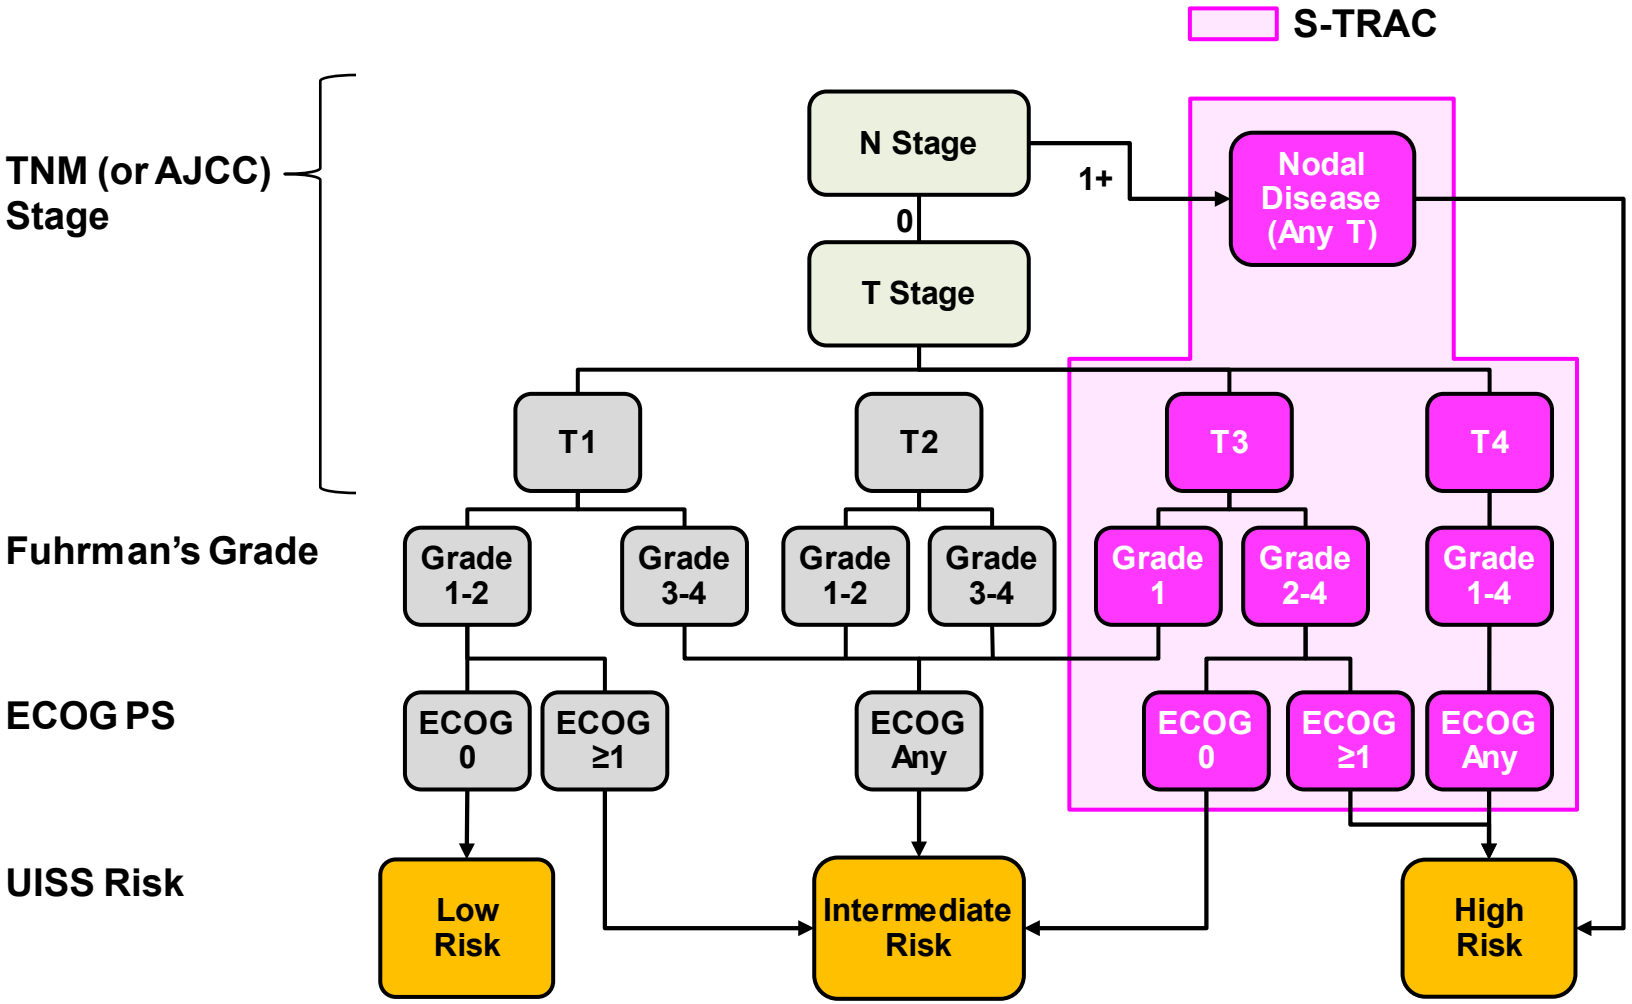
# Rationale for Disease-Free Survival (DFS) as a Primary Endpoint in Adjuvant RCC

- Patients want to remain disease-free, and DFS provides a direct real-time assessment of patient outcomes
- Long-term DFS is the primary goal for patients
- DFS is an earlier time point than OS in this patient population
- DFS is a consistent and accepted endpoint in many solid tumor adjuvant settings
  - Used for approval in various tumor types including colon cancer, breast cancer, melanoma, and GIST
  - Used in all current and planned adjuvant RCC studies

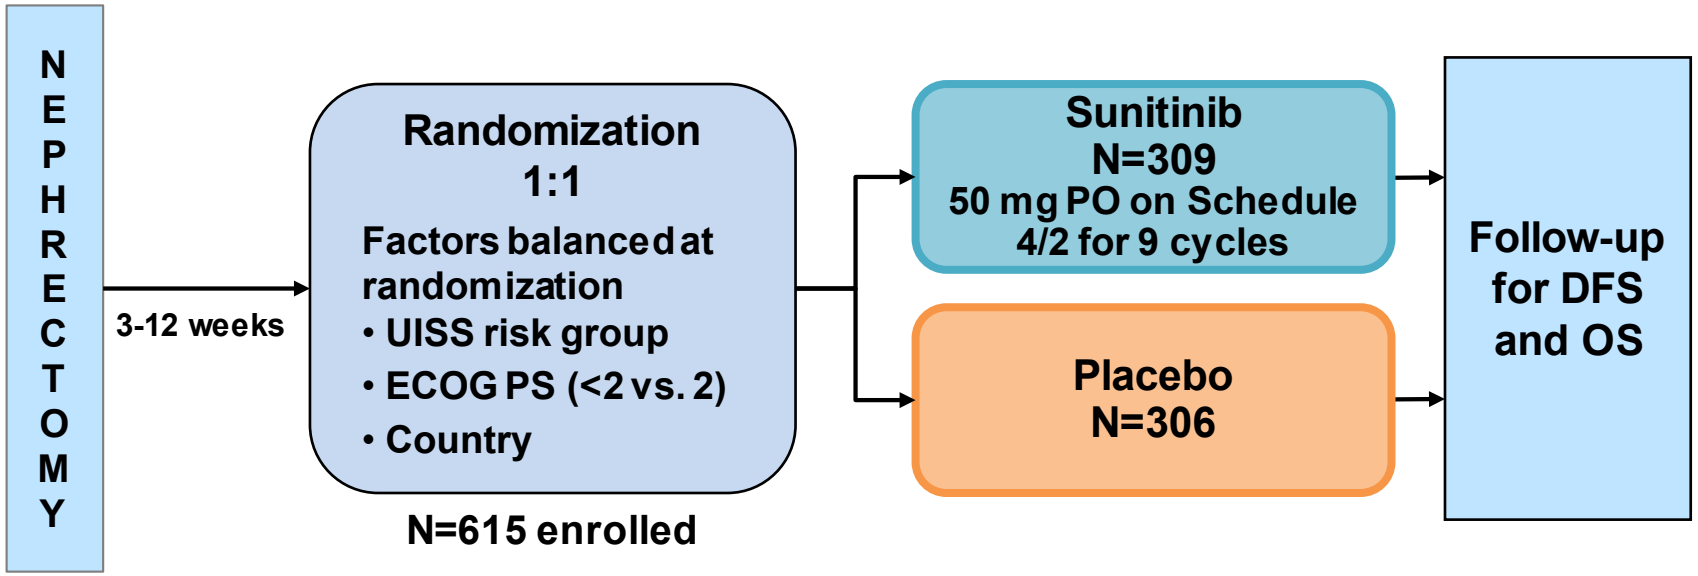
OS=Overall Survival

# Population Selected in S-TRAC
# UISS Risk Group Assignment



Adapted from: Zisman et al. *JCO* 2002;20:4561.; Lam JS, et al. *J Urol* 2005;74:466-472.

# Study 1109 (S-TRAC) Study Design



**Enrollment Criteria**
- Clear cell RCC
- ≥T3 and/or N+
- ECOG PS 0-2
- Lack of residual disease by BICR

**Primary Endpoint: Disease-Free Survival by Blinded Independent Central Review (BICR)**

External Data Monitoring Committee performed regular data reviews
PO=Per Orem (oral administration)

# S-TRAC
# Endpoints and Statistical Analysis

- Primary Endpoint: Disease-Free Survival (DFS) based on Blinded Independent Central Review
  - Two planned interim analyses
  - Final analysis after 5 years from last patient enrolled and ~258 DFS events
  - 84% power to detect a hazard ratio of 0.69 for DFS between the 2 treatment arms at a 2-sided significance level of 0.05
- Secondary Endpoints: Overall Survival (OS), Patient-Reported Outcomes (PROs), Safety

# S-TRAC
# Efficacy Conclusions

- In patients at high risk of recurrent RCC following nephrectomy, sunitinib demonstrated a statistically significant and clinically meaningful improvement in the primary DFS endpoint assessed by BICR compared with placebo

- The primary DFS result in favor of sunitinib was robust through the consistency of multiple sensitivity analyses

- No detrimental effect of sunitinib on overall survival observed

# Safety of Sunitinib for Adjuvant Treatment of RCC

***Liza DeAnnuntis, M.D.***

*Safety Risk Lead/Pharmacovigilance*

*Pfizer Oncology*

# Why Sunitinib as an Adjuvant Treatment?

Unmet Need

Efficacy

**Safety**

Benefit/Risk

- High-risk patients have a 60% risk of recurrence following nephrectomy and no available treatment options
- 24% relative DFS event risk reduction overall and 8% absolute DFS improvement at 5 years
- Adverse events are predictable, manageable and reversible
- Favorable for patients at high risk of recurrence

# Extensive Safety Experience for Sunitinib

- Sunitinib has been an available treatment in RCC for more than 11 years
- More than 350,000 patients have been treated with sunitinib globally since initial regulatory approval
- Most common AEs in clinical studies in approved indications (N=7115)
  - Diarrhea, Palmar-Plantar Erythrodysaesthesia syndrome (PPE), Hypertension, Fatigue/Asthenia, Nausea, Vomiting, Abdominal pain, Decreased appetite, Dysgeusia
- Well-characterized safety profile based on clinical studies and extensive post-marketing experience

AE=Adverse Event

# S-TRAC
# Overall Summary of Adverse Events (All Causality)[a]

| | Sunitinib N=306 n (%) | Placebo N=304 n (%) |
|---|---|---|
| Patients with AEs | 305 (99.7) | 269 (88.5) |

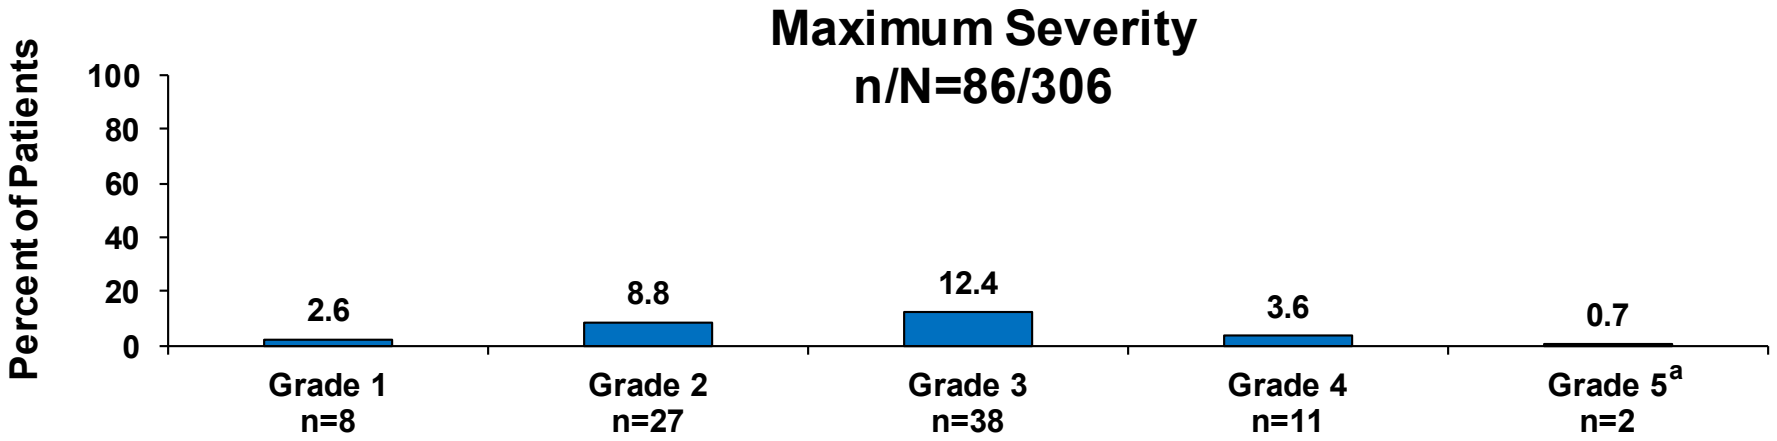
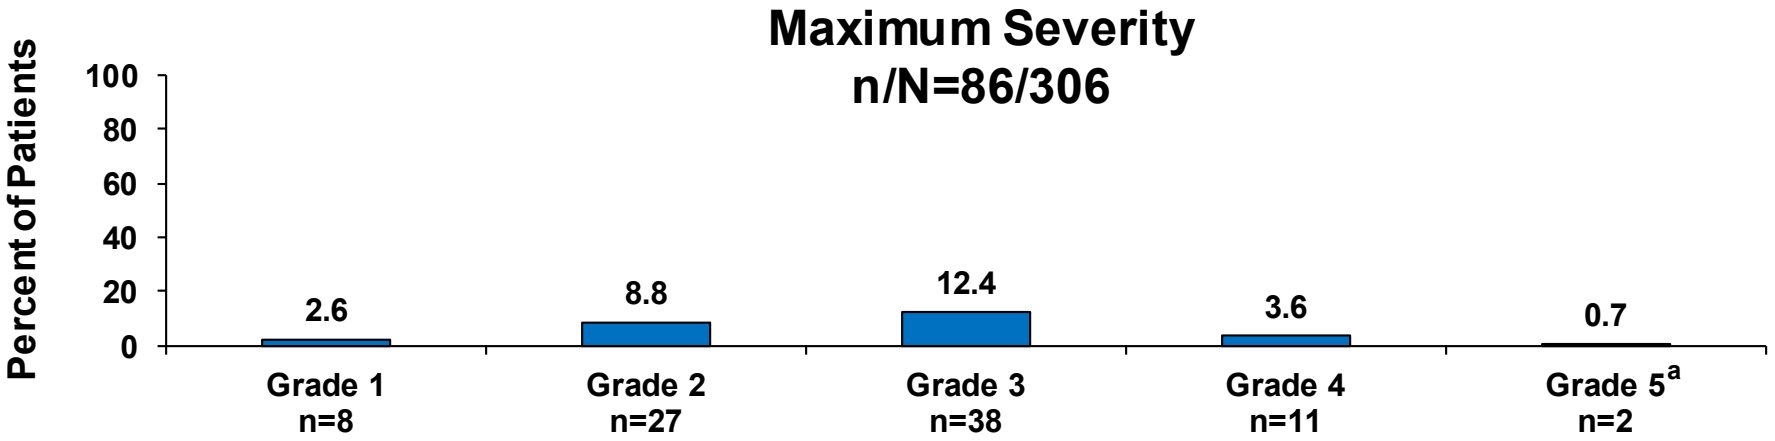
| Gastroesophageal reflux disease | 3 (1.0) | 0 |

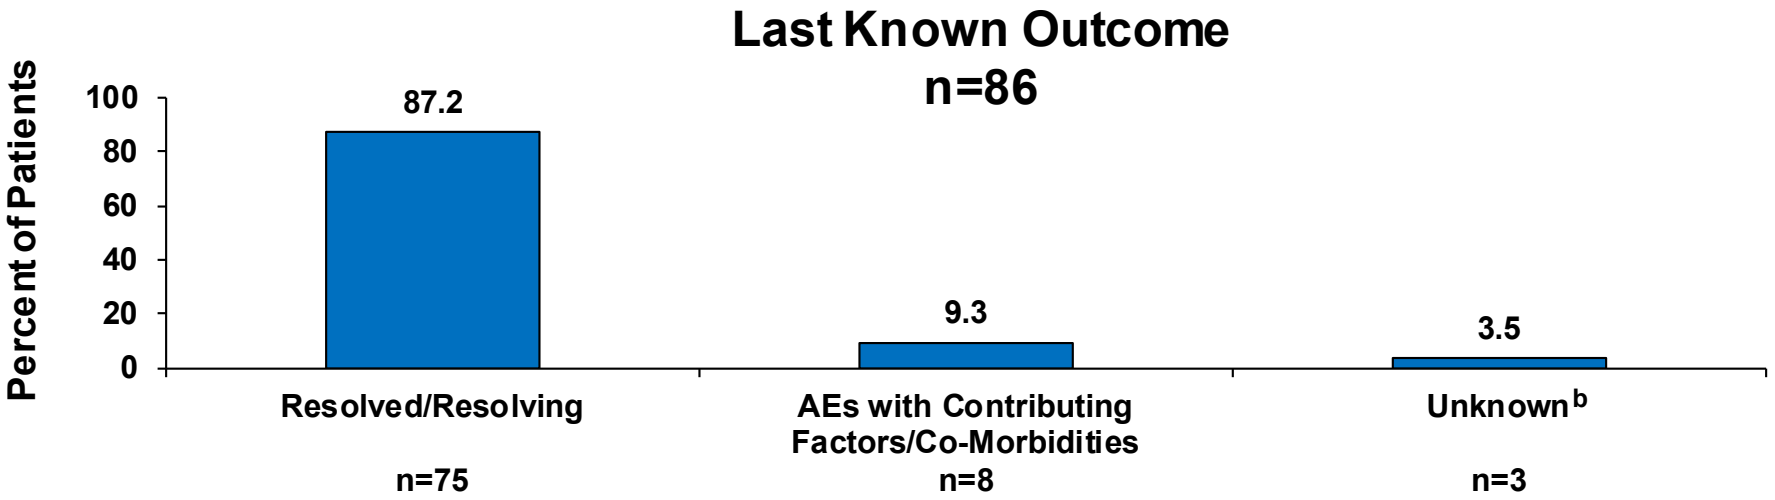
# S-TRAC
# Maximum Severity and Reversibility of TEAEs Leading to Permanent Discontinuation (All Causality)



a. Two Grade 5 events with fatal outcome unrelated to study treatment reported during active treatment period
b. Grade 2 and 3 PPE, Grade 2 unexpected therapeutic effect (increased thyroid function); AEs known to be manageable/reversible

# S-TRAC
# Maximum Severity and Reversibility of TEAEs Leading to Permanent Discontinuation (All Causality)





a. Two Grade 5 events with fatal outcome unrelated to study treatment reported during active treatment period
b. Grade 2 and 3 PPE, Grade 2 unexpected therapeutic effect (increased thyroid function); AEs known to be manageable/reversible

# S-TRAC
# Safety Conclusions

- Sunitinib adverse events are well understood
- Consistent with known safety profile
- No new safety signals observed
- No treatment-related deaths reported
- AEs were manageable and reversible via dosing interruption, dose reduction, and/or standard supportive treatment

| Sunitinib | 293 | 260 | 241 | 227 | 219 | 209 | 200 | 185 | 176 | 250 |
| Placebo | 288 | 274 | 264 | 249 | 234 | 231 | 220 | 212 | 203 | 249 |

Intent-To-Treat Population
QLQ-C30 was measured on Day 1 of each cycle. Patients were responding using the recall period of 1 week. Mean change from baseline based on repeated measures longitudinal analysis

# S-TRAC
# PRO Conclusions

- Patients at baseline reported few symptoms and high levels of functioning and global health status
- As expected, patients reported clinically meaningful worsening in diarrhea and loss of appetite, but no such worsening in other symptoms
- No clinically meaningful deterioration in functioning scales
  - Physical, Role, Emotional, Social, Cognitive
- No clinically meaningful deterioration in global health status/QoL

# Benefit/Risk of Sunitinib: Clinical Perspective

***Robert A. Figlin, M.D., FACP***

*Steven Spielberg Family Chair in Hematology Oncology*

*Professor of Medicine and Biomedical Sciences*

*Cedar-Sinai Medical Center, Los Angeles, CA*

# Why Sunitinib as an Adjuvant Treatment?

**Unmet Need**

- High-risk patients have a 60% risk of recurrence following nephrectomy and no available treatment options

**Efficacy**

- 24% relative DFS event risk reduction overall and 8% absolute DFS improvement at 5 years

**Safety**

- Adverse events are predictable, manageable and reversible

**Benefit/Risk**

- Favorable for patients at high risk of recurrence

# Previous Negative Adjuvant Trials of Non-Antiangiogenic Agents

| Author (Year) | Intervention |
|---|---|
| Kjaer (1987) | Radiation |
| Pizzocaro (1987) | Medroxyprogesterone |
| Galligioni (1996) | Tumor cells + BCG |
| Pizzocaro (2001) | IFN-α |
| Messing (2003) | IFN-α |
| Clark (2003) | IL-2 |
| Wood (2008) | HSPPC-96 |
| ARISER (2015) | Girentuximab |

- Many previous trials spanning 4 decades
- Different treatment approaches in varied patient populations
- High unmet medical need remains for patients with high risk of recurrence

BCG=Bacillus Calmette-Guerin; HSPPC=Heat Shock Protein Peptide Complex; IL=Interleukin

# Phase 3 Clinical Trials Evaluating Adjuvant Targeted Therapies in RCC

RDI=Relative Dose Intensity

# Differences in Study Design Drive Study Outcome

## S-TRAC

- Dosing
  - All patients started sunitinib at the full dose of 50 mg on Schedule 4/2
  - Dose reductions allowed to 37.5 mg
- Patients Included
  - Preponderant (defined as >50%) clear cell RCC
  - At high risk of recurrent RCC (locally advanced RCC, ≥T3 and/or N1-2)

## ASSURE

- Dosing
  - ~1/3 of patients received a starting sunitinib dose of 37.5 mg on Schedule 4/2
  - Dose reductions allowed to 25 mg
- Patients Included
  - ~21% of patients with a histology of non-clear cell RCC
  - 1/3 of patients with localized RCC (T1 and T2 without nodal involvement)

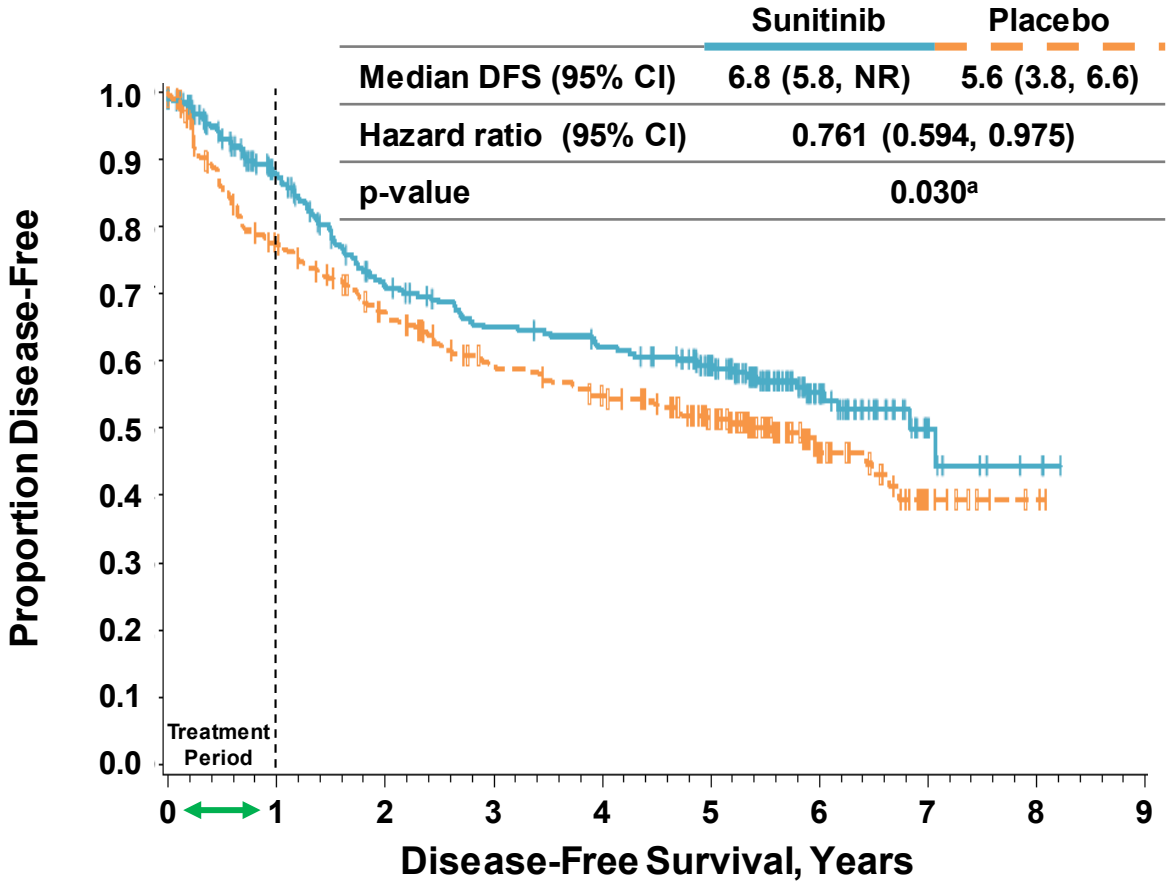
Modified from Motzer RJ et. al. *J Clin Oncol*. doi:10.1200/jco.2017.73.5324.

# S-TRAC
# Primary Endpoint: Disease-Free Survival By Blinded Independent Central Review



| No. at Risk | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|
| Sunitinib | 309 | 225 | 173 | 153 | 144 | 119 | 53 | 10 | 3 | 0 |
| Placebo | 306 | 220 | 181 | 150 | 135 | 102 | 37 | 10 | 2 | 0 |

- 24% reduction in relative risk of DFS events is clinically meaningful
- Persistent 8% absolute benefit
- Effect maintained over time

a. Two-sided p-value from log-rank test stratified by UISS high-risk group

# Sunitinib Adverse Events

- Sunitinib has a well-known safety profile
  - No new safety signals in S-TRAC
- Ability to reduce or interrupt dosing for patients who do not tolerate the full dose
- Side effects resolve after discontinuation of treatment
  - No known long-term sequelae
- Clinically manageable with early identification and monitoring

# Benefit/Risk Conclusion

- Favorable benefit/risk profile

- Sunitinib should be an adjuvant treatment option for patients at high risk of recurrent RCC following surgical resection

# What Does it Mean for the Patient with RCC at High Risk of Recurrence?

- High-risk patients have 5-year recurrence rate of approximately 60%
- Metastatic RCC is associated with substantial morbidity
- Survival after relapse remains unacceptably low
- No approved adjuvant therapy
- Patients want a higher chance of remaining disease-free

**Sunitinib is a valuable adjuvant treatment option for patients at high risk of recurrence**
