A biosimilar is a biological product

FDA-approved biosimilars have been compared to an FDA-approved biologic, known as the reference product. Reference and biosimilar products are:

- Large and generally complex molecules
- Produced from living organisms
- Carefully monitored to ensure consistent quality

A biosimilar is highly similar to a reference product

For approval, the structure and function of an approved biosimilar were compared to a reference product, looking at key characteristics such as:

- Purity
- Molecular structure
- Bioactivity

The data from these comparisons must show that the biosimilar is highly similar to the reference product.

A biosimilar has no clinically meaningful differences from a reference product

Studies were performed to show that biosimilars have no clinically meaningful differences in safety, purity, or potency (safety and effectiveness) compared to the reference product:

- Pharmacokinetic and, if needed, pharmacodynamic studies
- Immunogenicity assessment
- Additional clinical studies as needed

Studies may be done independently or combined.

A biosimilar is approved by FDA after rigorous evaluation and testing by the applicant

Prescribers and patients should have no concerns about using these medications instead of reference products because biosimilars:

- Meet FDA's rigorous standards for approval
- Are manufactured in FDA-licensed facilities
- Are tracked as part of post-market surveillance to ensure continued safety
