

# FDA-approved biosimilars are safe, effective options for patients.

**FDA-approved biosimilars have met the agency's rigorous standards for approval, and prescribers and their patients can count on the efficacy, safety and quality of these products.**

Biological products, including biosimilars, are used to treat a wide variety of life-threatening and life-altering diseases. A biosimilar approved by FDA meets rigorous standards and has no clinically meaningful differences from the FDA-approved reference product in terms of safety and effectiveness for its approved uses. The availability of FDA-approved biosimilars in the U.S. means that patients may have access to more medications at a potentially lower price.
