Current Definitions for Sleep Disordered Breathing in Adults

Susheel Patil, MD, PhD
Johns Hopkins University
Assistant Professor of Medicine
Clinical Director, Johns Hopkins Sleep Medicine
The Charge

FDA is seeking to promote innovation and expedite the clinical development of devices intended for the diagnosis and treatment of Sleep Disordered Breathing (SDB). How should the following conditions (including their severity, e.g., mild, moderate, severe, if appropriate) be defined for the purpose of creating appropriate inclusion/exclusion criteria for a clinical study for SDB devices?

- Apnea
- Hypopnea
- Sleep Disordered Breathing (SDB)
- Obstructive Sleep Apnea Syndrome (OSAS)
- Central Sleep Apnea Syndrome (CSAS)
- Primary Snoring
Terminology

• Sleep-Disordered Breathing
  – Umbrella term for a constellation of sleep-related breathing disorders and abnormalities of respiration during sleep that do not meet criteria for a disorder

  • Obstructive sleep apnea disorders
  • Central sleep apnea syndromes
  • Sleep-related hypoventilation disorders

  • Sleep-related hypoxemia
  • Primary snoring
  • Catathrenia

Obstructive Sleep Apnea (OSA) Syndrome
Center for Medicare/Medicaid Services

• Definition 1:
  – AHI or RDI ≥ 5 events/hour and ≤ 14 events/hour
  – Documents symptoms of excessive daytime sleepiness, impaired cognition, mood disorders or insomnia, or documented hypertension, ischemic heart disease, or history of stroke

• Definition 2:
  – AHI or RDI ≥ 15 events/hour

CMS. NCD for CPAP Therapy for OSA (240.4) Version Date 3/13/2008.
Obstructive Sleep Apnea (OSA) Syndrome
AASM ICSD-3

• Definition 1:
  – PSG or HSAT demonstrates ≥ 5 obstructive respiratory events per hour of sleep
  – The presence of one or more of the following:
    • The patient complains of sleepiness, non-restorative sleep, fatigue, or insomnia symptoms
    • The patient wakes with breath holding, gasping or choking
    • The bed partner or other observer reports habitual snoring, breathing interruptions or both during the patient’s sleep.
    • The patient has been diagnosed with hypertension, a mood disorder, cognitive dysfunction, coronary artery disease, stroke, congestive heart failure, atrial fibrillation, or type 2 diabetes mellitus

• Definition 2:
  – PSG or HSAT demonstrates ≥ 15 obstructive respiratory events per hour of sleep
Prevalence of SDB – Effect of sleepiness symptoms

Central Sleep Apnea (CSA) Syndromes

A collection of disorders characterized by central sleep apnea events:

- CSA with Cheyne-Stokes Respiration (CSR)
- CSA due to a medical disorder without CSR
- CSA due to high altitude periodic breathing
- CSA due to a medication or substance
- Primary CSA
Central Sleep Apnea (CSA) Syndromes
AASM ICSD-3

• PSG demonstrates all of the following:
  – ≥ 5 central apneas/hypopneas per hour of sleep
  – # of central apneas/hypopneas is > 50% of the total number of apneas and hypopneas
  – ONLY for CSB: Pattern of ventilation meets criteria for CSB

• At least one of the following symptoms:
  – Sleepiness
  – Difficulties initiating or maintaining sleep, frequent awakenings, or non-restorative sleep
  – Awakening short of breath
  – Snoring
  – Witnessed apneas

AASM. ICSD-3, 3rd edition, 2014
Primary Snoring

• A respiratory sound generated in the upper airway that typically occurs during inspiration but may also occur in expiration.

• Intensity varies and often will disturb the bed partner’s sleep or awaken the patient.

• Snoring **without** daytime sleepiness/fatigue or evidence of OSA is called primary snoring.
Terminology

- Apnea
- Hypopnea
- Respiratory effort related arousals
- Snoring
- Central vs. obstructive events
- Periodic breathing
Apnea

Hypopnea

Snoring
Sensors

Monitoring airflow

- **Pneumotachograph** – direct flow measurement – gold standard
- **Nasal pressure transducer** – used for hypopnea identification or apnea identification when thermal sensor not available
- **Oronasal thermal sensor** – typically used for apnea identification

Alternatives when above not available

- Respiratory Inductive plethysmography (RIP) – sum or flow derived signals
- Polyvinylidene fluoride (PVDF) sum
Sensors

Monitoring effort

• Esophageal manometry – gold standard – invasive
• Dual thoracoabdominal RIP
• Dual thoracoabdominal PDVF belts

Oxygen saturation

• Pulse oximetry with maximum signal averaging time ≤ 3 seconds

Snoring

• typically monitored by an acoustic sensor, piezoelectric sensor or nasal pressure transducer.
Signal processing

• Electrode impedances
• Digital resolution
• Sampling rate
• Filtering
Snoring

- A respiratory sound generated in the upper airway that typically occurs during inspiration but may also occur in expiration
- Cardinal symptom of OSA
- Snoring without daytime sleepiness/fatigue or evidence of OSA is called primary snoring.

No clear standardized definitions of snoring
A Definition of Snoring Based on Nasal Pressure Transducer (visualization)

• Lee SA, et al.
  – # of Snores/hour (snore – obvious deflection from background)
  – >3 snores in a 30 second epoch = snoring epoch
  – Snoring sleep time = # of snore epochs/ sleep time
    • Mild: 0-25%
    • Moderate: 25-50%
    • Severe: > 50%

Example Definitions of Snoring Based on Nasal Pressure Transducer (sound)

• Guzman MA, et al.
  – Snore with peak decibel ≥ 40 dB
    • WHO notes increasing adverse health effects within average night noise level is ≥ 40 dB/year
  – % of all breaths

• Kim J, et al.
  – Adaptive threshold method
  – ≥ 4x higher than background noise and up to 3s
  – Synchronization with inspiration

WHO. Night Noise Guidelines for Europe, 2009
How SDB events are defined

• Duration
  – ≥ 10 seconds

• Amplitude
  – How much – 10%, 30%, 50%, 90%?

• Consequence
  – Desaturation
  – Micro-arousal from sleep
Respiratory Events

• Apnea
  – A drop in peak signal excursion by $\geq 90\%$ of pre-event baseline for $\geq 10$ seconds using an oronasal thermal signal, PAP device flow, or an alternative apnea sensor.

  – No requirement for a desaturation or an arousal
Apnea Subtypes

Obstructive Apnea
Continued or increased inspiratory effort throughout the entire period of absent airflow.

AASM Manual for the Scoring of Sleep and Associated Events, v2.5
Stierer T. Anesth Clin N Am 2005;23:405
Apnea Subtypes

Central Apnea
Absent inspiratory effort throughout the entire period of absent airflow.

AASM Manual for the Scoring of Sleep and Associated Events, v2.5
Stierer T. Anesth Clin N Am 2005;23:405
Respiratory Events

• Cheyne-Stokes Breathing
  – Episodes of $\geq 3$ consecutive central apneas and/or hypopneas separated by a crescendo/decrescendo change in breathing amplitude with a cycle length of $\geq 40$ seconds, AND
  – There are $\geq 5$ central apneas and/or central hypopneas per hour of sleep associated with the crescendo/decrescendo breathing pattern recorded over $\geq 2$ hours of monitoring.
Apnea Subtypes

Mixed Apnea
Absent inspiratory effort in the initial portion of the event, followed by resumption of inspiratory effort in the second portion of the event.

AASM Manual for the Scoring of Sleep and Associated Events, v2.5
Stierer T. Anesth Clin N Am 2005;23:405
Respiratory Events

• Hypopnea (Recommended)
  – A drop in peak signal excursion by $\geq 30\%$ of pre-event baseline for $\geq 10$ seconds using nasal pressure, PAP device flow, or an alternative hypopnea sensor, AND

  – There is a $\geq 3\%$ oxygen desaturation from the pre-event baseline OR the event is associated with an arousal.
Respiratory Events

• Hypopnea (Acceptable) – used by CMS
  – A drop in peak signal excursion by $\geq 30\%$ of pre-event baseline for $\geq 10$ seconds using nasal pressure, PAP device flow, or an alternative hypopnea sensor.
  – There is a $\geq 4\%$ oxygen desaturation from the pre-event baseline.
Respiratory Events

• Hypopnea – Chicago criteria
  – A drop in peak signal excursion of airflow by $>50\%$ of pre-event baseline for $\geq 10$ seconds OR
  
  – A discernible reduction in airflow associated with either a $>3\%$ oxygen desaturation from the pre-event baseline or an arousal.

Obstructive Hypopneas with Desaturations
Obstructive Hypopnea with Arousals

- EEG
- SmEMG
- Airflow
- Effort
- SpO₂
Effect of Selection of Different Hypopnea Criteria

Definitions examined
- AASM AHI Rec: \( \geq 4\% \)
- AASM AHI Alt: \( \geq 3\% \) or arousal
- Chicago: \( \geq 3\% \) or arousal; OR
  > 50% amplitude reduction

AASM 2007 guidelines used a 30% reduction in amplitude
Effect of Selection of Different Hypopnea Criteria

Definitions examined
- AASM AHI Rec: $\geq 4\%$
- AASM AHI Alt: $\geq 3\%$ or arousal
- Chicago: $\geq 3\%$ or arousal; OR $> 50\%$ amplitude reduction

AASM 2007 guidelines used a 30% reduction in amplitude

Whitney CW Sleep 1998
Hypopnea subtypes

Assess for:

- Snoring during event
- Increased inspiratory flattening of the flow signal compared to baseline
- Thoracoabdominal paradox that occurs during the event

- Obstructive Hypopnea – if any one is present
- Central Hypopnea – if none are present

Many centers do not subclassify hypopneas due to inter-scorer reliability concerns
Respiratory Events

• Respiratory effort-related arousal (*optional*)
  – Sequence of breaths lasting ≥ 10 seconds characterized by increasing respiratory effort or by flattening of the inspiratory portion of the flow signal leading to an arousal from sleep when the sequence of breaths do not meet criteria for an apnea or hypopnea

*Not all centers score RERAs*
Does it Matter?

Apneas + Hypopneas + RERAs

- Intermittent falls in oxygen
- Arousals
- Pressure swings around the heart

Increased Sympathetic Activity

"Stress"

Surges in Blood Pressure

Sleep Disruption
Measures of SDB severity

• Apnea-hypopnea index (AHI):
  – # of apneas + hypopneas per hour of sleep

• Respiratory disturbance index (RDI):
  – # of apneas + hypopneas + RERAs per hour of sleep

• Oxygen desaturation index (ODI):
  – ≥ 3% or ≥ 4% oxygen desaturations per hour of sleep

• Respiratory Event Index (REI):
  – # of apneas + hypopneas per hour of monitored time
Clinically Used Severity Scheme

- AHI < 5: Normal
- AHI 5 – 15: Mild
- AHI 15 – 30: Moderate
- AHI ≥ 30: Severe

Consensus definition

AHI ≥ 30 was chosen for severe based on an increased risk of HTN from the Wisconsin cohort (4% hypopnea criteria – discernible reduction).

Is it All About the AHI?

“Most...studies have measured OSA with...the AHI. This degree of data reduction—from a full night of PSG to a single number—conceals a great degree of variation...that can occur between individuals with the same AHI...all commonly used OSA metrics still do not capture many facets of even the blood oxygen saturation...events (eg, depth, rapidity, and duration, clustering, sleep state and within-night variability....) that may be important....”

Peppard P Am J Respir Crit Care Med 2018
Thanks for your attention
Questions for Panel 1

• How should respiratory events be defined for clinical trials?
  – How should snoring, hypopneas, and apneas be defined?
  – Should different definitions of hypopneas be allowed?
  – Where is the balance between sensitivity and specificity?

• How should disease severity be defined for clinical trials?
  – Should there be different thresholds of AHI if different definitions are allowed?
  – Should definitions of SDB for clinical trials include symptoms?

• How should non-OSA forms of SDB defined for clinical trials involving digital health technologies?

• Should patient-reported outcomes be included in the definition of SDB?
Questions for Panel 1

For the purpose of creating appropriate inclusion/exclusion criteria for a clinical study for SDB devices, how should the FDA define?:

- **Respiratory events**
  - Apnea
  - Hypopnea
  - Snoring

- **Clinical disorders**
  - Sleep Disordered Breathing (SDB)
  - Obstructive Sleep Apnea Syndrome (OSAS)
  - Central Sleep Apnea Syndrome (CSAS)
  - Primary Snoring
