# **Epidermolysis Bullosa: Developing Drugs for Treatment of Cutaneous Manifestations Guidance for Industry**

## ***DRAFT GUIDANCE***

**This guidance document is being distributed for comment purposes only.**

Comments and suggestions regarding this draft document should be submitted within 60 days of publication in the *Federal Register* of the notice announcing the availability of the draft guidance. Submit electronic comments to <https://www.regulations.gov>. Submit written comments to the Dockets Management Staff (HFA-305), Food and Drug Administration, 5630 Fishers Lane, Rm. 1061, Rockville, MD 20852. All comments should be identified with the docket number listed in the notice of availability that publishes in the *Federal Register*.

For questions regarding this draft document, contact (CDER) Barbara Gould at 301-796-4224 or (CBER) the Office of Communication, Outreach, and Development at 800-835-4709 or 240-402-8010.

6

7  
8 This draft guidance, when finalized, will represent the current thinking of the Food and Drug  
9 Administration (FDA or Agency) on this topic. It does not establish any rights for any person and is not  
10 binding on FDA or the public. You can use an alternative approach if it satisfies the requirements of the  
11 applicable statutes and regulations. To discuss an alternative approach, contact the FDA staff responsible  
12 for this guidance as listed on the title page.  
13

14  
15  
16  
17 **I. INTRODUCTION**  
18

19 The purpose of this guidance is to assist sponsors with the development of drugs<sup>2</sup> for treatment  
20 or prevention of the serious cutaneous manifestations of the heterogeneous group of disorders  
21 collectively known as epidermolysis bullosa (EB).<sup>3</sup> There is an unmet medical need for EB  
22 patients due to the paucity of effective treatment options.  
23

- 24 • This guidance focuses on drug development and trial design issues specific to the treatment  
25 of EB, including FDA’s current thinking on endpoint considerations. There is not yet  
26 sufficient clinical trial precedent to guide definitive endpoint advice.  
27
- 28 • FDA strongly encourages sponsors to meet with the appropriate review division in early  
29 planning stages for advice tailored to each drug development program.  
30
- 31 – General issues, such as the efficacy evidence needed to support approval for serious and  
32 life-threatening diseases or approaches to adaptive study design, are discussed in

---

<sup>1</sup> This guidance has been prepared by the Division of Dermatology and Dental Drug Products and by the Rare Diseases Program in the Center for Drug Evaluation and Research in cooperation with the Center for Biologics Evaluation and Research at the Food and Drug Administration.

<sup>2</sup> For the purposes of this guidance, all references to *drugs* include both human drugs and therapeutic biological products unless otherwise specified.

<sup>3</sup> See the guidance for industry *Expedited Programs for Serious Conditions — Drugs and Biologics*. We update guidances periodically. For the most recent version of a guidance, check the FDA guidance web page at <https://www.fda.gov/RegulatoryInformation/Guidances/default.htm>.

## ***Contains Nonbinding Recommendations***

*Draft — Not for Implementation*

33 guidances for industry,<sup>4</sup> as are general issues of statistical analysis and control selection.<sup>5</sup>  
34 FDA's flexible approach to drug development for rare diseases in general, including the  
35 important topic of safety assessment, is also described in the draft guidance for industry  
36 *Rare Diseases: Common Issues in Drug Development*.<sup>6</sup>  
37

38 – The following guidances for industry provide recommendations for drug products  
39 intended for cellular and gene therapy:

40  
41 ■ Guidance for industry *Considerations for the Design of Early-Phase Clinical Trials*  
42 *of Cellular and Gene Therapy Products*

43  
44 ■ Guidance for industry *Gene Therapy Clinical Trials — Observing Subjects for*  
45 *Delayed Adverse Events*

46  
47 ■ Guidance for FDA reviewers and sponsors *Content and Review of Chemistry,*  
48 *Manufacturing, and Control (CMC) Information for Human Somatic Cell Therapy*  
49 *Investigational New Drug Applications (INDs)*

50  
51 – Some advice in the guidance for industry *Chronic Cutaneous Ulcer and Burn Wounds —*  
52 *Developing Products for Treatment* might be useful to developers of drugs for treatment  
53 of EB. However, the wound healing guidance is intended for acute burn wounds and  
54 chronic venous stasis, diabetic foot, and pressure ulcers. The distinct pathophysiology,  
55 natural history, and low prevalence of EB warrant distinct approaches.  
56

- 57 • In general, FDA's guidance documents do not establish legally enforceable responsibilities.  
58 Instead, guidances describe the Agency's current thinking on a topic and should be viewed  
59 only as recommendations, unless specific regulatory or statutory requirements are cited. The  
60 use of the word *should* in Agency guidances means that something is suggested or  
61 recommended, but not required.  
62

## **II. BACKGROUND**

63  
64  
65  
66 EB encompasses a clinically and genetically heterogeneous group of rare inherited disorders  
67 characterized by mechanical fragility of epithelial tissues due to defective proteins integral to  
68 epithelial structure and function. Epithelial integrity is critical for protection and function of  
69 organs and tissues, and prevention of water loss and infection. Thus, the magnitude of disease  
70 burden and unmet medical need posed by EB cannot be overstated.  
71

---

<sup>4</sup> See the guidance for industry *Providing Clinical Evidence of Effectiveness for Human Drug and Biological Products* and the draft guidance for industry *Adaptive Design Clinical Trials for Drugs and Biologics* (when final, this guidance will represent the FDA's current thinking on this topic).

<sup>5</sup> See the ICH guidances for industry *E9 Statistical Principles for Clinical Trials* and *E10 Choice of Control Group and Related Issues in Clinical Trials*, respectively.

<sup>6</sup> When final, this guidance will represent the FDA's current thinking on this topic.

## ***Contains Nonbinding Recommendations***

*Draft — Not for Implementation*

72 The classification of EB is evolving as new diagnostic techniques are developed.<sup>7</sup> EB has been  
73 traditionally divided into major subtypes based on the level within which blisters develop:  
74 intraepidermal (EB simplex), within (junctional EB) or beneath (dystrophic EB) the skin  
75 basement membrane zone, and mixed pattern (Kindler syndrome). More recent classification  
76 takes into account the mode of inheritance, phenotype, immunofluorescence antigen mapping  
77 findings, and gene defect. There is considerable variation in disease severity and natural history  
78 within each EB subtype because of modifying genetic and other factors.

79  
80

### **81 III. CONSIDERATIONS FOR CLINICAL TRIAL DESIGN**

82

#### **83 A. Trial Population**

84

85 • The trial population should have documentation of the clinical and laboratory evidence of the  
86 subtype(s) of EB that will form the basis of the proposed labeling claim (e.g., results of  
87 immunofluorescence antigen mapping or mutational analysis). Genetic testing, if performed,  
88 should also be documented; however, it should not be a requirement for study entry if  
89 mutational analysis is not relevant to the desired claim. Patients with adequate prior  
90 documented diagnosis generally need not have testing repeated.

91

92 – The diagnostic method(s) used by a sponsor for the purposes of trial enrollment should be  
93 based on the characteristics of the specific development program, such as:

94

- 95 ▪ The investigational drug's mechanism of action, if known
- 96 ▪ The pathophysiology and natural history of the EB subtype(s) to be treated
- 97 ▪ The clinical trial endpoints and efficacy assessment tools

98

99 • Because EB subtypes differ in the extent and distribution of cutaneous wounds and the level  
100 of skin cleavage, results from an efficacy trial in EB simplex cannot be generalized to the  
101 more severe EB subtypes.

102

103 • Sponsors are encouraged to discuss the desired study EB population early with the FDA  
104 review division. The trial population should be representative of the phenotypic spectrum of  
105 interest, to the extent possible given the low prevalence of EB.

106

107 • Because the junctional and dystrophic forms of EB generally present clinically at birth,  
108 sponsors should also anticipate discussing with the review division any challenges and  
109 additional requirements for drug development in pediatric patients, especially with respect to  
110 trials in infancy and early childhood.<sup>8</sup>

<sup>8</sup> See 21 CFR part 50, subpart D, Additional Safeguards for Children in Clinical Investigations.

## *Contains Nonbinding Recommendations*

*Draft — Not for Implementation*

### 113 **B. Efficacy Endpoints**

114

115 • Clinical trials should be designed to minimize bias with randomization whenever possible  
116 and include an appropriate control to show that the drug provides clinically meaningful  
117 improvement in at least one symptom or sign of EB. In appropriate cases, a single adequate  
118 and well-controlled trial with supporting evidence may suffice.<sup>9</sup> Examples of meaningful  
119 improvement might include significant relief from itching, pain, blister prevention, and  
120 wound healing, among others.

121

122 – Before commencing clinical trials for EB, it is critically important to reach agreement  
123 with FDA about the primary efficacy endpoint(s) and the magnitude of change that will  
124 demonstrate clinically meaningful improvement, such as the degree of wound healing.

125

126 – We encourage sponsors to propose endpoints for which there is (or will be before trial  
127 initiation) a validated and sufficiently sensitive assessment method.

128

129 – Patient-reported outcome (PRO) instruments<sup>10</sup> and observer-reported outcome (ObsRO)  
130 instruments<sup>11</sup> play an important role in establishing effectiveness of EB treatment because  
131 they provide evidence of how patients feel or function in daily life. Sponsors should  
132 incorporate patient and caregiver perspectives in efficacy endpoint development.

133

134 ■ FDA is not aware of PRO or ObsRO instruments shown to be adequate for regulatory  
135 use to assess improvement in EB, but sponsors are welcome to submit existing or  
136 modified PRO, ObsRO, and/or clinician-reported outcome instruments.

137

138 ■ The guidance for industry *Patient-Reported Outcome Measures: Use in Medical*  
139 *Product Development to Support Labeling Claims* provides information about  
140 developing such instruments.

141

### 142 **C. Special Considerations**

143

144 Sponsors should consider development and validation of assessment tools and processes that  
145 minimize visits to study sites and maximize patient comfort, such as photographic/video  
146 documentation of wounds during routine dressing changes in the home, data collection via  
147 patient diaries, and telemedicine, among others.

148

<sup>11</sup> U.S. Food and Drug Administration and U.S. National Institutes of Health Biomarker Working Group, 2016, BEST (Biomarkers, EndpointS, and other Tools) Resource, Glossary Section Terms and Definitions under letter O, available at <https://www.ncbi.nlm.nih.gov/books/NBK338448/#IX-O>, accessed April 19, 2018.

## *Contains Nonbinding Recommendations*

*Draft — Not for Implementation*

149 In studies involving drug products intended for gene therapy, there should be assessments related  
150 to lentivirus vector-based risks and long-term follow-up.

151

### 152 *1. Junctional and Dystrophic Subtypes*

153

154 Trial recruitment and retention of patients with junctional and dystrophic subtypes of EB  
155 (characterized by extreme skin fragility) are challenging because trial procedures can exacerbate  
156 skin damage and increase the economic effect of intensive daily wound care. In addition,  
157 because of the low prevalence of these subtypes, these patients may be geographically remote  
158 from specialty centers. When designing clinical trials, sponsors are encouraged to prospectively  
159 consider:

160

161 • Damage to the skin and pain associated with travel.

162

163 • Identification of the essential aspects of skin care that must be standardized for trial  
164 interpretability versus those aspects that can remain patient or caregiver preference.

165

166 • Restriction of venipuncture and other procedures to those essential to efficacy evaluation,  
167 safety monitoring, and pharmacokinetic studies. For enrolled patients with extracutaneous  
168 manifestations, trial procedures and sample collection should coincide with patient care  
169 procedures performed under sedation.

170

### 171 *2. EB Simplex*

172

173 Seasonal timing and geographic location of enrollment should address the disease-modifying  
174 influence of ambient temperature and physical activity.

175
