ADVICE ABOUT EATING FISH
For Women Who Are or Might Become Pregnant, Breastfeeding Mothers, and Young Children

Eating fish‡ when pregnant or breastfeeding can provide health benefits.
Fish and other protein-rich foods have nutrients that can help your child’s growth and development. As part of a healthy eating pattern, eating fish may also offer heart health benefits and lower the risk of obesity.

Nutritional Value of Fish
The 2015-2020 Dietary Guidelines for Americans recommends:

• At least 8 ounces of seafood (less for young children) per week based on a 2,000 calorie diet
• Women who are pregnant or breastfeeding to consume between 8 and 12 ounces of a variety of seafood per week, from choices that are lower in mercury.

Fish are part of a healthy eating pattern and provide:

• Protein
• Healthy omega-3 fats (called DHA and EPA)
• More vitamin B₁₂ and vitamin D than any other type of food
• Iron which is important for infants, young children, and women who are pregnant or who could become pregnant
• Other minerals like selenium, zinc, and iodine.

Choose a variety of fish that are lower in mercury. (See chart on other side of page.)
While it is important to limit mercury in the diets of women who are pregnant and breastfeeding and young children, many types of fish are both nutritious and lower in mercury.

This advice supports the recommendations of the 2015-2020 Dietary Guidelines for Americans, developed for people 2 years and older, which reflects current science on nutrition to improve public health. The Dietary Guidelines for Americans focuses on dietary patterns and the effects of food and nutrient characteristics on health. For advice about feeding children under 2 years of age, you can consult the American Academy of Pediatrics®.

‡ THIS ADVICE REFERS TO FISH AND SHELLFISH COLLECTIVELY AS “FISH” / ADVICE REVISED JULY 2019
This chart can help you choose which fish to eat, and how often to eat them, based on their mercury levels.

**What is a serving?** As a guide, use the palm of your hand.

**For an adult** 1 serving = 4 ounces  
Eat 2 to 3 servings a week from the “Best Choices” list  
(OR 1 serving from the “Good Choices” list).

If you eat fish caught by family or friends, check for fish advisories. If there is no advisory, eat only one serving and no other fish that week.*

**Choices to Avoid**  **HIGHEST MERCURY LEVELS**

|                           |                     |
| King mackerel | Shark |
| Marlin        | Swordfish | Tilefish |
| Orange roughy |         | (Gulf of Mexico) |
|               |         | Tuna, bigeye |

* Some fish caught by family and friends, such as larger carp, catfish, trout and perch, are more likely to have fish advisories due to mercury or other contaminants. State advisories will tell you how often you can safely eat those fish.

This advice supports the recommendations of the 2015-2020 Dietary Guidelines for Americans, developed for people 2 years and older, which reflects current science on nutrition to improve public health. The Dietary Guidelines for Americans focuses on dietary patterns and the effects of food and nutrient characteristics on health. For advice about feeding children under 2 years of age, you can consult the American Academy of Pediatrics.†
