Pilot Office of Oncologic Diseases (OOD) Safety Team Standard Data Requests

- As part of your NDA/BLA submission, we ask that you prepare the datasets and conduct the safety analyses with the assumptions and dataset variables as below.
- Please provide define files (PDF and .xml with stylesheet) and a reviewer's guide for submitted datasets.

ADSL - Subject level Analysis Dataset (adsl.xpt):

Structure: One record per subject

- Ensure variables used in adsl.xpt are the same as in other datasets
- In addition to the CDISC required variables for adsl and variables necessary for analyses for the submitted trials, the dataset should include the key variables listed below with identifiers for each trial period/drug as applicable (not an all-inclusive list):

ADAE – Adverse Events Analysis Dataset (adae.xpt)

Structure: One record per subject per adverse event per start date

- Safety analyses should be completed on the safety population evaluating treatment-emergent adverse events using the definitions below:
  - Safety population: patients who received at least one dose of study drug, even if randomized to comparator arm and dosed in error. (Patients dosed with the wrong medication for safety purposes should be analyzed in the arm of the treatment they actually received)
  - Treatment-emergent adverse events (TEAE): new or worsening events occurring in the safety population at or after the first drug treatment up to and including 30 days after last dose of study drug or the day prior to start of subsequent therapy (whichever comes first).
    - The following scenarios should be considered, and sponsors should clearly note in the reviewer's guide if any AEs with the following criteria are included in the sponsor's AE analyses in the application:
      - Any worsening beyond day 30 after the last dose of study drug of an AE that was considered treatment-emergent (e.g. if a subject's pancreatitis started at Grade 4 on Day 25 after last dose of study drug and on Day 35 after the last dose of study drug the subject had Grade 5 pancreatitis, this event should be included in the definition of TEAE used in the safety analyses.)
      - AEs starting more than 30 days after last dose if that AE was determined by the sponsor to be related to any of the study drugs.

- **Dataset should include the key variables listed below (not an all-inclusive list):**

ADLB: Laboratory Analysis Dataset (adlb.xpt):

Example structure: One record per subject per visit per parameter

- Analyses should be completed using evaluable laboratory values
  - Evaluable laboratory values = values from patients with a baseline and at least one on-study value (denominators used to calculate percentages in incidence tables will vary)
- Only results that worsened by at least one grade from baseline should be displayed in the sponsor's safety tables in the CSR and safety summaries
- Laboratory values should be graded as per CTCAE if applicable (do not grade if CTCAE grade does not exist). Analyses for non-CTCAE gradable laboratory values should be clearly described in the reviewer's guide
- For each type of lab test, only one standard unit should be used, which is defined in LBSTRESU. LBSTRESN (lab test value in standard unit), LBSTNRLO (lower limit of normal in standard unit), and LBSTNRHI (higher limit of normal in standard unit) should be consistent with LBSTRESU.
- **Datasets should include the key variables listed below (not an all-inclusive list):**

ADEX: Exposure Analysis Dataset (adex.xpt)

Structure: One record per subject per treatment (EXTRT) per start date.

- Include variables and parameters where applicable for trial design.
- The timing for ADEX is based on start date, but VISIT and VISITNUM should be added if present in EX.
- The timing for ADEXSUM is AEVLINT, Analysis Interval for Evaluation. AVISIT should not be present. ADT should be included if there are any sponsor-defined parameter that flag a specific value over an evaluation interval (e.g., first value or highest value) to indicate the date that the value in AVAL was observed.
