Since the beginning of the COVID-19 pandemic, the FDA has worked to facilitate the development and availability of therapeutics as expeditiously and safely as possible for use by patients, physicians, and health systems.

As of November 23, 2020, the FDA has approved one treatment for COVID-19. The antiviral drug Veklury (remdesivir) is approved for use in adult and pediatric patients 12 years of age and older and weighing at least 40 kilograms (about 88 pounds) for the treatment of COVID-19 requiring hospitalization. Veklury should only be administered in a hospital or in a health care setting capable of providing acute care comparable to inpatient hospital care.

In order to facilitate the development of potential COVID-19 treatments, the FDA created the Coronavirus Treatment Acceleration Program (CTAP) to expedite the development of therapeutics by using every tool at the agency’s disposal to determine if they are safe and effective for their intended uses.

Numerous other therapeutics are currently being tested in clinical trials to evaluate whether they are safe and effective in combating COVID-19. The CTAP webpage includes a dashboard with a snapshot of the development of potential COVID-19 therapeutics. As of October 31, 2020, there were more than 370 active trials of therapeutic agents and more than 560 development programs for therapeutic agents in the planning stages.

The FDA continues to provide advice, guidance, and technical assistance to help expedite the development of these products and intends to use regulatory flexibility in making these products and other critical medical countermeasures available to prevent and treat COVID-19. Sponsors wishing to develop therapeutics for proposed COVID-19 use are encouraged to submit information and requests for drug development to: COVID19-productdevelopment@fda.hhs.gov.

The FDA and other government partners are working with industry to make treatment options available to patients and providers who are not able to participate in clinical trials, including through expanded access under investigational new drug (IND) applications.

Additionally, if certain statutory criteria are met, the FDA may issue an emergency use authorization (EUA) to allow unapproved medical products or unapproved uses of approved medical products to be used in an emergency to diagnose, treat, or prevent serious or life-threatening diseases or conditions caused by chemical, biological, radiological, or nuclear threat agents when, among other factors, there are no adequate, approved, and available alternatives.

As of November 30, 2020, the following EUAs permit the use of drugs or biological products to treat COVID-19 and serious conditions caused by COVID-19:
