PRINCIPLE

CAUTION

For U.S.A. only, Federal law restricts this device to sale and distribution by or on the order of a physician, or to a clinical laboratory; and use is restricted to by or on the order of a physician.

INTENDED USE

The Access SARS-CoV-2 IgG assay is a paramagnetic particle, chemiluminescent immunoassay intended for the qualitative detection of IgG antibodies to SARS-CoV-2 in human serum, serum separator tubes, and plasma (lithium heparin, dipotassium EDTA, tripotassium EDTA, and sodium citrate). The Access SARS-CoV-2 IgG assay is intended for use as an aid in identifying individuals with an adaptive immune response to SARS-CoV-2, indicating recent or prior infection. At this time, it is unknown for how long antibodies persist following infection and if the presence of antibodies confers protective immunity. Testing is limited to laboratories certified under the Clinical Laboratory Improvement Amendments of 1988 (CLIA), 42 U.S.C. §263a, that meet requirements to perform moderate or high complexity tests.

Results are for the detection of SARS CoV-2 antibodies. IgG antibodies to SARS-CoV-2 are generally detectable in blood several days after initial infection, although the duration of time antibodies are present post-infection is not well characterized. Individuals may have detectable virus present for several weeks following seroconversion.

Laboratories within the United States and its territories are required to report all positive results to the appropriate public health authorities.
The sensitivity of the Access SARS-CoV-2 IgG assay after infection is unknown. Negative results do not preclude acute SARS-CoV-2 infection. If acute infection is suspected, direct testing for SARS-CoV-2 is necessary.

False positive results for the Access SARS-CoV-2 IgG assay may occur due to cross-reactivity from pre-existing antibodies or other possible causes.

The Access SARS-CoV-2 IgG assay is only for use under the Food and Drug Administration's Emergency Use Authorization.

SUMMARY AND EXPLANATION

Coronavirus disease-2019 (COVID-19) is caused by a novel coronavirus known as severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2) which has spread worldwide in 2020 causing a global pandemic. COVID-19 is characterized by fatigue, fever, cough, shortness of breath and other respiratory symptoms.\(^1\) The virus uses the transmembrane receptor angiotensin-converting enzyme 2 (ACE-2) to infect epithelial cells in the airways and lungs.\(^2\) Some individuals infected with SARS-CoV-2 have no, or mild symptoms while others develop severe respiratory distress requiring mechanical ventilation.\(^3\) Infected individuals develop an immune response to the virus in the form of anti-SARS-CoV-2 IgM and IgG antibodies over the course of days to weeks.\(^4\) Testing for the presence of IgM/IgG antibodies to SARS-CoV-2 can help to inform clinical management of patients with current, or recent COVID-19.

METHODOLOGY

The Access SARS-CoV-2 IgG assay is a two-step enzyme immunoassay. A sample is added to a reaction vessel with buffer, and paramagnetic particles coated with recombinant SARS-CoV-2 protein specific for the receptor binding domain (RBD) of the S1 protein.\(^5\) After incubation in a reaction vessel, materials bound to the solid phase are held in a magnetic field while unbound materials are washed away. A monoclonal anti-human IgG alkaline phosphatase conjugate is added and the conjugate binds to the IgG antibodies captured on the particles. A second separation and wash step remove unbound conjugate. A chemiluminescent substrate is added to the vessel and light generated by the reaction is measured with a luminometer. The light production is compared to the cut-off value defined during calibration of the instrument.

SPECIMEN COLLECTION AND PREPARATION

Blood Specimen
1. The role of preanalytical factors in laboratory testing has been described in a variety of published literature.\textsuperscript{6,7} To minimize the effect of preanalytical factors observe the following recommendations for handling and processing blood samples: \textsuperscript{6}

   A. Collect all blood samples observing routine precautions for venipuncture.
      a. Follow blood collection tube manufacturer’s recommendations for centrifugation.
      b. Ensure residual fibrin and cellular matter has been removed prior to analysis.

   B. Allow serum samples to clot completely before centrifugation in a vertical position, with the collection tube closure directed upwards.
      a. Follow the tube manufacturer’s recommendations for the length of serum/cells contact time before centrifuging samples. The clotting may be slower at cooler temperatures, or if the patient is on anticoagulant therapy.

2. Each laboratory should determine the acceptability of its own blood collection tubes and separation products that are in use. There may be variations in these products between manufacturers and between manufacturing lots.

3. Alternate collection types may be appropriate if the laboratory has established its own performance characteristics as defined by applicable law.

4. Avoid assaying lipemic or hemolyzed samples.

**WARNING AND PRECAUTIONS**

• For in vitro diagnostic use.
• This test has not been FDA cleared or approved; this test has been authorized by FDA under an EUA for use by laboratories certified under CLIA, that meet requirements to perform moderate or high complexity tests.
• This test has been authorized only for the presence of IgG antibodies against SARS-CoV-2, not for any other viruses or pathogens.
• This test is only authorized for the duration of the declaration that circumstances exist justifying the authorization of emergency use of in vitro diagnostic tests for detection and/or diagnosis of COVID-19 under Section 564(b)(1) of the Act, 21 U.S.C. § 360bbb-3(b)(1), unless the authorization is terminated or revoked sooner.
• Samples and blood-derived products may be routinely processed with minimum risk using the procedure described. However, handle these products as potentially infectious according to universal precautions and good clinical laboratory practices, regardless of their origin, treatment, or prior certification. Use an appropriate disinfectant for decontamination. Store and dispose of these materials and their containers in accordance with local regulations and guidelines.

• For hazards presented by the product refer to the following sections: REACTIVE INGREDIENTS and GHS HAZARD CLASSIFICATION.
REACTIVE INGREDIENTS

CAUTION
Sodium azide preservative may form explosive compounds in metal drain lines. See NIOSH Bulletin: Explosive Azide Hazard (8/16/76). To avoid the possible build-up of azide compounds, flush wastepipes with water after the disposal of undiluted reagent. Sodium azide disposal must be in accordance with appropriate local regulations.

GHS HAZARD CLASSIFICATION

SARS-CoV-2 IgG Particles (Compartment R1a) WARNING

H317 May cause an allergic skin reaction.
H412 Harmful to aquatic life with long lasting effects.
P273 Avoid release to the environment.
P280 Wear protective gloves, protective clothing and eye/face protection.
P333+P313 If skin irritation or rash occurs: Get medical advice/attention.
P362+P364 Take off contaminated clothing and wash it before use.

reaction mass of: 5-chloro-2-methyl-4-isothiazolin -3-one [EC# 247-500-7] and 2-methyl-4-isothiazolin-3-one [EC# 220-239-6](3:1) < 0.05%

SARS-CoV-2 IgG Conjugate Diluent (Compartment R1b) WARNING

H317 May cause an allergic skin reaction.
H412 Harmful to aquatic life with long lasting effects.
P273 Avoid release to the environment.
P280 Wear protective gloves, protective clothing and eye/face protection.
P333+P313 If skin irritation or rash occurs: Get medical advice/attention.
P362+P364 Take off contaminated clothing and wash it before use.

reaction mass of: 5-chloro-2-methyl-4-isothiazolin -3-one [EC# 247-500-7] and 2-methyl-4-isothiazolin-3-one [EC# 220-239-6](3:1) < 0.05%
SARS-CoV-2 IgG Conjugate (Compartment R1c)

**WARNING**

H317 May cause an allergic skin reaction.
H412 Harmful to aquatic life with long lasting effects.
P273 Avoid release to the environment.
P280 Wear protective gloves, protective clothing and eye/face protection.
P333+P313 If skin irritation or rash occurs: Get medical advice/attention.
P362+P364 Take off contaminated clothing and wash it before use.

**Reaction mass of:** 5-chloro-2-methyl-4-isothiazolin-3-one [EC# 247-500-7] and 2-methyl-4-isothiazolin-3-one [EC# 220-239-6](3:1) < 0.05%

---

SARS-CoV-2 IgG Ancillary Diluent (Compartment R1d)

**WARNING**

H316 Causes mild skin irritation.
H317 May cause an allergic skin reaction.
H319 Causes serious eye irritation.
H412 Harmful to aquatic life with long lasting effects.
P273 Avoid release to the environment.
P280 Wear protective gloves, protective clothing and eye/face protection.
P332+P313 If skin irritation occurs: Get medical advice/attention.
P333+P313 If skin irritation or rash occurs: Get medical advice/attention.
P337+P313 If eye irritation persists: Get medical advice/attention.
P362+P364 Take off contaminated clothing and wash it before use.

Ethoxylated lauryl alcohol 1 - < 3%

**Reaction mass of:** 5-chloro-2-methyl-4-isothiazolin-3-one [EC# 247-500-7] and 2-methyl-4-isothiazolin-3-one [EC# 220-239-6](3:1) < 0.05%

- Store upright.
- Refrigerate at 2°C to 10°C for a minimum of two hours before use on the instrument.
- Signs of possible deterioration are a broken elastomeric layer on the pack or quality control values out of range.
• If the reagent pack is damaged (e.g., a broken elastomer), discard the pack.
• Discard reagents if any discoloration is observed.

CALIBRATION

CALIBRATION INFORMATION

An active calibration point is required for all tests. For the SARS-CoV-2 IgG assay, a calibration is required every 28 days. See calibrator Instructions for Use (IFU) for additional calibration information. Refer to the appropriate system manuals and/or Help system for information on calibration method, configuring calibrators, calibrator test request entry, and reviewing calibration data.

QUALITY CONTROL

Quality control materials simulate the characteristics of samples and are essential for monitoring the system performance of immunochemical assays. Include quality control materials in each 24-hour time period, or as required by individual laboratory procedures, because samples may be processed at any time in a “random access” format rather than a “batch” format.

Include Access SARS-CoV-2 IgG QC or other commercially available quality control materials that cover at least two levels of analyte.

More frequent use of quality controls or the use of additional controls is left to the discretion of the operator, based upon good laboratory practices or laboratory accreditation requirements and applicable laws. Follow manufacturer’s instructions for reconstituting and storing controls. Each laboratory should establish mean values and acceptable ranges to assure proper performance. Quality control results that do not fall within acceptable ranges may indicate invalid test results. Examine all test results that were generated since obtaining the last acceptable quality control test point for this analyte. Refer to the appropriate system manuals and/or Help system for information about reviewing quality control results.

TESTING PROCEDURE(S)

PROCEDURE

1. Refer to the appropriate system manuals and/or Help system for a specific description of installation, start-up, principles of operation, system performance characteristics, operating instructions, calibration procedures, operational limitations and precautions, hazards, maintenance, and troubleshooting.
   A. The system default unit of measure for sample results is S/CO.
2. Mix the contents of a new (unpunctured) reagent pack by gently inverting the pack several times before loading it on the instrument. Do not invert an open (punctured) pack.
3. Use twenty (20) µL of sample for each determination, in addition to the sample container and system dead volumes, when requesting the SARS-CoV-2 IgG assay.
4. Refer to the appropriate system manuals and/or Help system for information on managing samples, configuring tests, requesting tests, and reviewing test results.

LIMITATIONS

For Use under an Emergency Use Authorization Only

1. Do not dilute samples as this could lead to incorrect results.
2. For assays that employ antibodies, the possibility exists for interference by heterophile antibodies in the test sample. Patients who are regularly exposed to animals, or are subjected to medical treatments that utilize immunoglobulins or immunoglobulin fragments, may produce human anti-animal antibodies, e.g. HAMA, that interfere with immunoassays. These interfering antibodies may cause erroneous results.
3. Other potential interferences could be present in the sample and may cause erroneous results in immunoassays. Some examples that are documented in literature include rheumatoid factor, endogenous alkaline phosphatase,
fibrin, and proteins capable of binding to alkaline phosphatase.\(^9\) Carefully evaluate results if the sample is suspected of having these types of interferences.

4. The Access SARS-CoV-2 IgG assay results should be interpreted in light of the total clinical presentation of the patient, including: symptoms, clinical history, data from additional tests, and other appropriate information.

5. Results from antibody testing should not be used as the sole basis to diagnose or exclude SARS-CoV-2 infection or to inform infection status.

6. Negative results do not preclude acute SARS-CoV-2 infection. IgG antibodies may not be detected in the first few days of infection; the sensitivity of the Access SARS-CoV-2 IgG assay early after infection is unknown. If acute infection is suspected, direct testing for SARS-CoV-2 is necessary.

7. A negative result can occur if the quantity of antibodies for the SARS-CoV-2 virus present in the specimen is below the detection limit of the assay, or if the virus has undergone minor amino acid mutation(s) in the epitope recognized by the antibody used in the test.

8. A positive result may not indicate previous SARS-CoV-2 infection. Consider other information, including clinical history and local disease prevalence, in assessing the need for an alternative serology test to confirm an immune response. Positive results may be due to past or present infection with non-SARS-CoV-2 coronavirus strains, such as coronavirus HKU1, NL63, OC43, or 229E.

9. False positive test results for IgG antibodies can occur due to cross-reactivity with pre-existing antibodies or from other possible causes.

10. This test is not to be used for screening donated blood.

**Conditions of Authorization for the Laboratory**

1. Authorized laboratories* using your product will include with test result reports, all authorized Fact Sheets. Under exigent circumstances, other appropriate methods for disseminating Fact Sheets may be used, which may include mass media.

2. Authorized laboratories using your product will use it as outlined in the Instructions for Use. Deviations from the authorized procedures, including the authorized instruments, authorized clinical specimen types, authorized control materials, authorized other ancillary reagents and authorized materials required to use this product are not permitted.

3. Authorized laboratories that receive your product will notify the relevant public health authorities of their intent to run your product prior to initiating testing.

4. Authorized laboratories using your product will have a process in place for reporting test results to healthcare providers and relevant public health authorities, as appropriate.

5. Authorized laboratories will collect information on the performance of this product and report to DMD/OHT7-OIR/OPEQ/CDRH (via email: CDRH-EUA-Reporting@fda.hhs.gov) and Beckman Coulter, Inc. (Customer Technical Support: 1-800-854-3633; Customer portal: www.beckmancoulter.com) any suspected occurrence of false reactive or false non-reactive results and significant deviations from the established performance characteristics.

6. All laboratory personnel using your product must be appropriately trained in automated immunoassay techniques and use appropriate laboratory and personal protective equipment when handling this kit, and use this product in accordance with the authorized labeling. All laboratory personnel using the assay must also be trained in and be familiar with the interpretation of results of the product.

7. Beckman Coulter, Inc., authorized distributors, and authorized laboratories using your product will ensure that any records associated with this EUA are maintained until otherwise notified by FDA. Such records will be made
available to FDA for inspection upon request.

*The letter of authorization refers to, "Laboratories certified under the Clinical Laboratory Improvement Amendments of 1988 (CLIA), 42 U.S.C. §263a, that meet the requirements to perform moderate or high complexity tests" as "authorized laboratories."

RESULTS INTERPRETATION

Test results are determined automatically by the system software. Detection of analyte in the sample is determined from the measured light production by means of the stored calibration data. Results are reported as reactive or non-reactive. Results located 20% below the cut-off are interpreted as equivocal, and should be carefully reviewed.
For samples in the equivocal zone, it is recommended that a new sample be collected and tested approximately one to two weeks later using the Access SARS-CoV-2 IgG assay. A conversion from equivocal to reactive for IgG antibody should be considered as evidence of seroconversion due to recent infection. The equivocal result (gray zone) > 0.80 to < 1.00 S/CO must be saved in memory by the user. A flag (“GRY”), which is automatically reported, allows the user to quickly see a result located within the equivocal range. Refer to the appropriate system manuals and/or Help system for complete instructions for set up of gray zone for a qualitative assay and reviewing sample results.

**PERFORMANCE CHARACTERISTICS**

**POSITIVE AGREEMENT**

The positive percent agreement (PPA) of the Access SARS-CoV-2 IgG assay was evaluated in 192 serum and plasma samples from symptomatic individuals diagnosed with SARS-CoV-2 by PCR methods from France and the United States. The results are presented in the following table, classified by days between the positive PCR test and the blood sample draw. The evaluation was determined by the Wilson Score method.

<table>
<thead>
<tr>

The positive percent agreement of the Access SARS-CoV-2 IgG assay in serum and plasma specimens >18 days after a positive PCR was 100% (51/51; 95% CI 93.0 – 100%). The positive percent agreement for all tested specimens was 92.7% (178/192; 95% CI 88.1 – 95.6%).

**LONGITUDINAL STUDY**

Seroconversion was evaluated in a panel of 75 serum and plasma specimens collected from 20 symptomatic and PCR-positive individuals with 2 or more post PCR blood draws. Of the 20 individual patients, 13 patients showed positive results in all blood draws, 2 patients showed negative results for all draws, and 5 individual patients showed SARS-CoV-2 IgG seroconversion. The

**NEGATIVE PERCENT AGREEMENT**

The negative percent agreement of the Access SARS-CoV-2 IgG assay was evaluated in a study of 1,400 samples collected prior to December 2019* in France and the United States. This total includes 1,000 samples from blood donors in France and 200 samples each from routine clinical laboratory diagnostic samples in France and the United States. Based on this evaluation, the overall negative percent agreement of the Access SARS-CoV-2 IgG assay is 99.6% (1395/1400), with a 95% confidence interval of 99.2% - 99.9% determined by the Wilson Score method.
Population | Total Samples | Number Non-Reactive | Number Reactive | Number Equivocal | NPA (95% CI)
---|---|---|---|---|---
Blood Donors (France) | 1,000 | 997 | 2 | 1 | 99.7% (99.1-99.9%)
Diagnostic Samples (France) | 200 | 199 | 1 | 0 | 99.5% (97.2-99.9%)
Diagnostic Samples (United States) | 200 | 199 | 0 | 1 | 99.5% (97.2-99.9%)
Total | 1,400 | 1,395 | 3 | 2 | 99.6% (99.2-99.9%)

*It has been shown that over 90% of the adult population have antibodies to all four common circulating coronaviruses.10,11

INTERFERING SUBSTANCES
High concentrations of endogenous serum components were assessed for interference in the Access SARS-CoV-2 IgG assay. The test protocol was based on CLSI EP07, Interference Testing in Clinical Chemistry, 3rd Edition.12 Human serum was spiked with a patient sample containing SARS-CoV-2 IgG antibodies to achieve a positive reactivity in the Access SARS-CoV-2 IgG assay. None of the substances tested demonstrated significant interference in the Access SARS-CoV-2 IgG assay as defined by a shift in concentration greater than 20% using the test concentrations indicated in the table below.

CROSS REACTIVITY
Cross-reactivity of the Access SARS-CoV-2 IgG assay was evaluated by testing serum and plasma samples for each of the potentially cross-reacting conditions listed in the following table. No cross-reactivity was observed for the Access SARS-CoV-2 IgG assay.

PRINCIPLE

CAUTION

For U.S.A. only, Federal law restricts this device to sale and distribution by or on the order of a physician, or to a clinical laboratory; and use is restricted to by or on the order of a physician.

INTENDED USE

The Access SARS-CoV-2 IgG Calibrators are intended to calibrate the Access SARS-CoV-2 IgG assay for the in vitro qualitative detection of SARS-CoV-2 IgG antibodies in human serum, serum separator tubes and plasma (lithium heparin, dipotassium EDTA, tripotassium EDTA, and sodium citrate) for use on the Access Family of Immunoassay Systems only.

SUMMARY AND EXPLANATION

The Access SARS-CoV-2 IgG Calibrator is used to establish calibration (determine the cut-off value) for the Access SARS-CoV-2 IgG assay. By comparing the light intensity generated by a sample to the cut-off value, the presence or absence of SARS-CoV-2 IgG antibodies in the sample is determined.

TRACEABILITY

The analyte in the Access SARS-CoV-2 IgG Calibrator is traceable to the manufacturer's working calibrators. Traceability process is based on EN ISO 17511.
The assigned values were established using representative samples from this lot of calibrator, and are specific to the assay methodologies of the Access reagents. The values assigned by other methodologies may be different. Such differences, if present, may be caused by inter-method bias.

**REAGENTS**

**CONTENTS**

**Access SARS-CoV-2 IgG Calibrator**  
Ref. No. C58963: C0-C1, 2.0 mL/vial

- Provided ready to use.
- Store upright and refrigerate at 2 to 10°C.
- Mix contents by gently inverting before use. Avoid bubble formation.
- Stable until the expiration date stated on the label when stored at 2 to 10°C.
- Vial is stable at 2 to 10°C for 90 days after initial use.
- Signs of possible deterioration are quality control values out of range.
- Refer to calibration card for exact concentrations.

**WARNING AND PRECAUTIONS**

- **For in vitro diagnostic use.**
- Samples and blood-derived products may be routinely processed with minimum risk using the procedure described. However, handle these products as potentially infectious according to universal precautions and good clinical laboratory practices, regardless of their origin, treatment, or prior certification. Use an appropriate disinfectant for decontamination. Store and dispose of these materials and their containers in accordance with local regulations and guidelines.
- The antibody used to prepare the reagent is derived from human plasma. Always consider these products to be potentially infectious. Regardless of their origin, treatment, or prior certification, handle them according to universal precautions and good clinical laboratory practices. Use an appropriate disinfectant for decontamination. Store and dispose of these materials and their containers according to local regulations and guidelines.
- For hazards presented by the product refer to the following sections: REACTIVE INGREDIENTS and GHS HAZARD CLASSIFICATION.
- This product has not been FDA cleared or approved; this product has been authorized by FDA under an EUA for use by laboratories certified under CLIA, that meet requirements to perform moderate or high complexity tests. This product is only authorized for the duration of the declaration that circumstances exist justifying the authorization of emergency use of in vitro diagnostics for detection and/or diagnosis of COVID-19 under Section 564(b)(1) of the Act, 21 U.S.C. § 360bbb-3(b)(1), unless the authorization is terminated or revoked sooner.
REACTIVE INGREDIENTS

CAUTION
Sodium azide preservative may form explosive compounds in metal drain lines. See NIOSH Bulletin: Explosive Azide Hazard (8/16/76). To avoid the possible build-up of azide compounds, flush wastepipes with water after the disposal of undiluted reagent. Sodium azide disposal must be in accordance with appropriate local regulations.

GHS HAZARD CLASSIFICATION

SARS-CoV-2 IgG C0  WARNING

H317  May cause an allergic skin reaction.
H412  Harmful to aquatic life with long lasting effects.
P273  Avoid release to the environment.
P280  Wear protective gloves, protective clothing and eye/face protection.
P333+P313  If skin irritation or rash occurs: Get medical advice/attention.
P362+P364  Take off contaminated clothing and wash it before use.
reaction mass of: 5-chloro-2-methyl-4-isothiazolin-3-one [EC# 247-500-7] and 2-methyl-4-isothiazolin-3-one [EC# 220-239-6](3:1) < 0.05%

SARS-CoV-2 IgG C1  WARNING

H317  May cause an allergic skin reaction.
H412  Harmful to aquatic life with long lasting effects.
P273  Avoid release to the environment.
P280  Wear protective gloves, protective clothing and eye/face protection.
P333+P313  If skin irritation or rash occurs: Get medical advice/attention.
P362+P364  Take off contaminated clothing and wash it before use.
reaction mass of: 5-chloro-2-methyl-4-isothiazolin-3-one [EC# 247-500-7] and 2-methyl-4-isothiazolin-3-one [EC# 220-239-6](3:1) < 0.05%
CALIBRATION

CALIBRATION INFORMATION

The Access SARS-CoV-2 IgG Calibrators are provided as: negative and positive. Assay calibration data are valid up to 28 days.

Run the calibrators in triplicate.

TESTING PROCEDURE(S)

PROCEDURE

Refer to the appropriate system manuals and/or Help system for information on calibration theory, configuring calibrators, calibrator test request entry, and reviewing calibration data.

PROCEDURAL NOTES

LIMITATIONS

If there is evidence of microbial contamination or excessive turbidity in a reagent, discard the vial.

PRINCIPLE

CAUTION

For U.S.A. only, Federal law restricts this device to sale and distribution by or on the order of a physician, or to a clinical laboratory; and use is restricted to by or on the order of a physician.

INTENDED USE

The Access SARS-CoV-2 IgG QC is for use on the Access Family of Immunoassay Systems only.

SUMMARY AND EXPLANATION

Quality control (QC) materials simulate the characteristics of patient samples and are essential for monitoring the system performance of the Access SARS-CoV-2 IgG immunoassay. In addition, they are an integral part of good laboratory practices. When performing assays with Access reagents for SARS-CoV-2 IgG, include quality control materials to validate the integrity of the assays. The assayed values should fall within the acceptable range if the test system is working properly.

TRACEABILITY

The analyte in the Access SARS-CoV-2 IgG QC is traceable to the manufacturer’s working calibrators. Traceability process is based on EN ISO 17511. The assigned values were established using representative samples from this lot of
QC, and are specific to the assay methodologies of the Access reagents. The values assigned by other methodologies may be different. Such differences, if present, may be caused by inter-method bias.

GHS HAZARD CLASSIFICATION

SARS-CoV-2 IgG QC1 WARNING

H317 May cause an allergic skin reaction.
H412 Harmful to aquatic life with long lasting effects.
P273 Avoid release to the environment.
P280 Wear protective gloves, protective clothing and eye/face protection.
P333+P313 If skin irritation or rash occurs: Get medical advice/attention.
P362+P364 Take off contaminated clothing and wash it before use.

reaction mass of: 5-chloro-2-methyl-4-isothiazolin-3-one [EC# 247-500-7] and 2-methyl-4-isothiazolin-3-one [EC# 220-239-6](3:1) < 0.05%

SARS-CoV-2 IgG QC2 WARNING

H317 May cause an allergic skin reaction.
H412 Harmful to aquatic life with long lasting effects.
P273 Avoid release to the environment.
P280 Wear protective gloves, protective clothing and eye/face protection.
P333+P313 If skin irritation or rash occurs: Get medical advice/attention.
P362+P364 Take off contaminated clothing and wash it before use.

reaction mass of: 5-chloro-2-methyl-4-isothiazolin-3-one [EC# 247-500-7] and 2-methyl-4-isothiazolin-3-one [EC# 220-239-6](3:1) < 0.05%

Safety Data Sheet is available at techdocs.beckmancoulter.com

TESTING PROCEDURE(S)

PROCEDURE

Use the Access Immunoassay System to determine the concentration of SARS-CoV-2 IgG in the Access SARS-CoV-2 IgG QC materials in the same manner as a sample. Include quality control materials in each 24-hour time period, or as required by individual laboratory procedures, because samples may be processed at any time in a "random access" format rather than a "batch" format. More frequent use of controls or the use of additional controls is left to the discretion...
of the operator, based upon good laboratory practices or the laboratory accreditation requirements and applicable laws. Refer to the appropriate system manuals and/or Help system for information on quality control theory, configuring controls, quality control sample test request entry, and reviewing quality control data.

**REPORTING RESULTS**

**EXPECTED RESULTS**

For the value assignment of Access SARS-CoV-2 IgG QC material, select and assay a number of samples that are representative of the entire lot to provide a reliable estimate of the mean value. The mean values and standard deviations are listed on the QC value card. There are variations, such as technique, equipment, or reagents, which may cause results that are different from the listed values. Therefore, each laboratory should establish its own mean values and standard deviations (SD).

**PROCEDURAL NOTES**

**LIMITATIONS**

If there is evidence of microbial contamination or excessive turbidity in a reagent, discard the vial.
