WARNING

Performing the collection procedure:
- If recommended to use gloves and eyeware when
  these with water if irritation persists, seek medical advice.
- If the specimen does not come in contact with the body,
  avoid contact with skin and eyes.
- Keep out of reach of children.
- Do NOT ingest the stabilizing buffer.
- Follow directions for use.

For use by individuals 14 years and older (self-collected under
COVID-19 testing). Additional information can be downloaded at

Welcome to your Wren Laboratories COVID-19
Saliva Test Collection Kit

Your test kit includes the following components:
- Paper requisition
- Saliva collection device
- A shipping box
- 2 sealing strips
- A pre-paid return label
- A Biohazard Specimen Bag with absorbent material.

Do not discard biohazard bag. Required for return shipping.

Instructions for use

Step 1: Register Your Test Kit. Use your smartphone camera
to scan the QR Code on the enclosed tube. This will take you to a website
where you will be prompted to enter your information as directed.

(In case you cannot use a smartphone to enter your personal data
and complete the online requisition form, please visit:
www.wrencovidtesting.com/start or you can use the paper requisition).

STOP Do not start the saliva collection process before you have
completed the registration of your test kit.

Once registration is complete, open your test kit and place all contents on
a clean, dry surface. Now go to Step 2.

Note: An instructional video demonstrating the saliva collection process is available online (www.wrencovidtesting.com).
Do not eat, drink (even water), brush your teeth, or smoke, for 30 minutes prior to collecting your saliva sample. If you have trouble collecting enough saliva gently rub the outside of your cheeks, just behind your back teeth while performing chewing motions with your mouth.

Collect enough saliva to fill at least up to the red line as marked on the tube.

**Step 2: Collecting Saliva Sample**

Your sample must be returned/shiped on the same day it was collected to ensure timely receipt at the laboratory for processing.

1. Attach the funnel to the tube (screw it on gently) until fully attached.
2. Collect your saliva sample. Fill the tube until the saliva (not including bubbles) is just above the red line. Do not overfill.
3. Remove the funnel from the tube and discard the funnel.
4. Firmly screw the cap down onto the tube. This will release the red solution and seal the tube. You will know this has worked because your saliva will change color. **Firmly tighten the cap to ensure the cap and tube are completely sealed.**
5. Shake the tube gently for 10 seconds. This will guarantee your sample mixes thoroughly with the stabilizing solution.
6. WARNING: DO NOT OPEN OR REMOVE CAP ONCE SEALED

   Write your initials, date of birth and today’s date on the collection tube label using either pen or pencil.

7. Place the collection tube into the Biohazard Specimen Bag with the absorbent material. **Do not remove any absorbent material from the bag.** Place the paper requisition (if applicable) in the Biohazard Specimen Bag and seal. Wash and dry your hands thoroughly before moving on to Step 3.

**Step 3: Ship Sample via FedEx**

1. Place the Specimen Bag with the collected sample into the box.
2. Attach the pre-paid return shipping label to the top of the box. Write your name under the order number.
3. Important! Record your FEDEX tracking information in the box below before shipment. Keep this document for your records.
4. Seal the Box using the two enclosed strips on each side of the box. Deliver the box to a FedEx drop box or to a FedEx location.
5. Your results will be emailed to you and your HCP. If positive, presumptive positive, or invalid, you will be contacted by your HCP for a recommended course of care and follow-up.
