 GREGoR (Mendelian Genomics) Data Coordinating Center  
 Substantial knowledge to the genetic basis of thousands of Mendelian diseases have been discovered over the past decade, but diagnostic rates across the full set of conditions remain low. The NHGRI Mendelian Genomics Research Consortium will apply technological and data-sharing innovations to accelerate the further discovery and genetic characterization of Mendelian conditions. The Data Coordinating Center for the Consortium, will lead efforts to establish Consortium-wide data standards, utilize cloud-based resources to enable rapid data sharing among Consortium members and timely release to the broader scientific community. It will also coordinate program logistics and outreach.

“Protein-enhanced enteral nutrition and metabolomics in critically ill trauma and surgical patients”  
(A132484 *Enteral protein*)

This application aims to understand whether high dose early enteral protein supplementation can improve biochemical markers of nutrition and metabolism and whether we can use clinical and metabolomic data to estimate urinary nitrogen excretion and predict protein needs in critically ill surgical and trauma patients. Taken together, this study will move us closer to applying precision nutritional support and improve the outcomes and reduce the costs of caring for critically ill patients.

Perturbing the HIV Reservoir with Immune Stimulation

This study will test standard vaccines in chronically treated participants to identify those vaccines that are able to induce the largest amount of cell-associated HIV RNA from infected lymphocytes. A randomized control trial of these vaccines will be performed in study participants who started ART within six months of their HIV infection. The primary objective of the study will be to determine if participants in the vaccine arm have more instances of detectable cell-associated HIV RNA than the placebo group.

Building the evidence base for appropriate and effective treatment of childhood pneumonia, evaluating the effectiveness of 3 days versus 5 days twice daily amoxicillin dispersible tablets therapy

This project includes two double-blind randomized controlled clinical trials of amoxicillin DT for childhood pneumonia among children 2-59 months of age presenting to Kamuzu Central Hospital in Lilongwe, Malawi. One of the trials compares three days of amoxicillin DT versus placebo for fast-breathing childhood pneumonia. The other compares five days of amoxicillin DT versus three days of amoxicillin DT for chest-in-drawing pneumonia.
