BEFORE GETTING STARTED
1. Wash or sanitize your hands. Make sure they are dry before proceeding.
2. Check the expiration date on the back of the box. DO NOT use if expired.

PREPARE THE MATERIALS
3. Bring test to room temperature. On a flat level surface, retrieve all materials from the box and place the empty box in front of you for further use.
4. Arrange the materials on a clean, dry, flat surface.
   Your box may contain more than one test kit. Use only 1 of each of the materials provided for each test. DO NOT open the individual pouches until instructed to do so.
5. Open large test card pouch and place the test card on flat surface. DO NOT touch any parts on the insides of the test card.

PERFORMING THE TEST
6. Remove test tube from it’s pouch. Press the test tube into the marked hole on the front of the box.
7. Twist the top off of the buffer solution and pour all of it into the test tube.
   If any liquid spills and does not enter into the tube, discard test kit, and re-start test using a new test kit.
8. Open swab package from its stick end and remove the swab from this end.
   DO NOT touch the swab head.
9. Swab both nostrils carefully with the soft tip as shown.
   **Step A)** Insert 1/2 to 3/4 of an inch of the first nostril, making at least 15 seconds per nostril.
   DO NOT insert the swab any farther if you feel any resistance.
   **Step B)** Using medium pressure, rub and rotate the swab against the inside of the first nostril, making at least 5 circles (taking about 15 seconds).
   **Step C)** Repeat in the other nostril.
   MAKE AT LEAST 5 BIG CIRCLES
   15 SECONDS PER NOSTRIL
   NOTE: If you are swabbing others, please wear a face mask. With children, the maximum depth of insertion into the nostril may be less than 1/2 of an inch for very young children, you may need another person to steady the child’s head while swabbing.
10. Completely immerse the swab tip in the solution and mix well by rotating at least 10 times with one hand while holding the box with the other.
   Be sure to mix thoroughly.
11. While holding the swab stable in the liquid, take the test tube out of the box.
   Raise the swab tip out of the buffer, holding it in place within the side walls of the tube, and squeeze the tube 5 times to remove as much of the liquid from the swab as possible. Failure to squeeze the tube can lead to incorrect results due to excess buffer in the swab.
   Discard the swab.
12. Remove dropper tip from its pouch. Push the dropper tip securely into the tube and swirl 5x. Turn test tube over, hold it straight up and down, and gently squeeze 3 drops into the sample well on the test card.
   DO NOT apply the liquid in the rectangular results window.
13. Set the timer and read the test result at 15 minutes. (Timer Not Included)
   DO NOT disturb the card during this time. Inaccurate results can occur if the card is disturbed/moved or test results are read before 15 minutes.
   DO NOT interpret test results after 30 minutes.

STOP Check: Did you swab BOTH nostrils?
NOTE: inaccurate test results may occur if the nasal sample is not properly collected.

TEST RESULT INTERPRETATION
Repeat testing is needed to improve test accuracy. Please follow the table below when interpreting test results for COVID-19.

NEGATIVE
If the Control (C) line is visible, but the Test (T) line is not visible, the test is negative. To increase the chance that the negative result for COVID-19 is accurate, you should:
- Test again in 48 hours if you have symptoms on the first day of testing.
- Test 2 more times at least 48 hours apart if you do not have symptoms on the first day of testing.
A negative test result indicates that the virus that causes COVID-19 was not detected in your sample. A negative result is presumptive, meaning it is not certain that you do not have COVID-19. You may still have COVID-19 and you may still be contagious. There is a higher chance of false negative results with antigen tests compared to laboratory-based tests such as PCR. If you test negative and continue to experience COVID-19-like symptoms, (e.g., fever, cough, and/or shortness of breath) you should seek follow up care with your health care provider.

POSITIVE
If the Control (C) line and the Test (T) line are visible, the test is positive. Any faint visible red test line (T) with the control line (C) should be read as positive. You do not need to perform repeat testing if you have a positive result at any time.
A positive test result means that the virus that causes COVID-19 was detected in your sample and it is very likely you have COVID-19 and are contagious. Please contact your doctor/primary care physician or your local health authority immediately and adhere to the local guidelines regarding self-isolation.
There is a small chance that this test can give a positive result that is incorrect (a false positive).

INVALID
If the control (C) line is not visible, the test is invalid. Re-test with a new swab and new test device.

AFTER TEST IS COMPLETED, DISPOSE OF USED MATERIALS IN HOUSEHOLD TRASH.

REPORT YOUR TEST RESULTS at www.MakeMyTestCount.org – this voluntary and anonymous reporting helps public health teams understand COVID-19 spread in your area and across the country and informs public health decisions.
The Speedy Swab Rapid COVID-19 Antigen Self-Test is intended for non-prescription self-use and as an alternate laboratory testing for individuals aged two years or older. This test is intended to be used as an aid in the clinical diagnosis presented with symptoms of COVID-19 to your family and others in your community. If irritation persists, seek medical advice: https://www.poison- help.org or 1-800-222-1222.

Chemical Name | GHS Code for Each Individual | Concentration
---|---|---
Proclin 300 | H317, aerosol skin irritation | 0.1%
Trimethylsilyl acetamide | H316, mild skin irritation | 0.03%

HOW TO USE THIS TEST

Serial testing should be performed in all individuals with negative results; individuals with symptoms of COVID-19 and initial negative results should be tested again after 48 hours. Individuals without symptoms of COVID-19, and with initial negative results, should be tested again after 48 hours, and if the 2nd test is also negative, a 3rd time after an additional 48 hours. You may need to purchase additional tests to perform this serial (repeat) testing.

If your test negative but continue to have symptoms of COVID-19, and both second tests are negative, you may have COVID-19, however you should follow-up with your healthcare provider.

• Do not use kit past its expiration date.
• Do not touch the strip face.
• Once opened, the test card should be used within 60 minutes.
• Do not read test results before 15 minutes or after 30 minutes. Results read before 15 minutes or after 30 minutes may lead to a false positive, false negative, or invalid result.
• Keep testing kit and kit components away from children and pets before use. Avoid use of the kit and its components with at least 48 hours between tests for a total of three tests. If you have a negative result, it does not rule out SARSCoV-2 infection; you should still isolate and follow-up with your healthcare provider.

Serial testing is recommended for individuals with negative results; individuals with symptoms of COVID-19 and initial negative results should be tested again after 48 hours. Individuals without symptoms of COVID-19, and with initial negative results, should be tested again after 48 hours, and if the 2nd test is also negative, a 3rd time after an additional 48 hours. You may need to purchase additional tests to perform this serial (repeat) testing.

• Read all instructions carefully before performing the test. Follow the instructions carefully for accurate test results.

• Read all instructions carefully before performing the test. Follow the instructions carefully for accurate test results.

• If irritation persists, seek medical advice: https://www.poison-help.org or 1-800-222-1222.

Rapid COVID-19 Antigen Self-Test

In the USA, this product has not been FDA cleared or approved, but has been authorized by FDA under an Emergency Use Authorization. This product has been authorized only for the detection of proteins from SARS-CoV-2, not for any other viruses or pathogens. The emergency use of this device is authorized for the duration of the declaration that circumstances exist justifying the authorization of emergency use of in vitro diagnostics for detection and/or diagnosis of SARS-CoV-2 under Section 564(b)(3) of the Federal Food, Drug, and Cosmetic Act, 21 U.S.C. § 360bbb-3 (b)(3), until the declaration is terminated or authorization is revoked sooner.

In Vitro Diagnostic (IVD) use only.

• For Emergency Use Authorization (EUA) only.

• The results of this test may help limit the potential spread of COVID-19 as compared to a molecular test, especially in samples with low viral load.

• The performance of this test was established based on the evaluation of a limited number of clinical specimens collected between January to June, 2022. The clinical performance has not been established for all circulating variants but is anticipated to be reflective of the prevalent variants in circulation at the time and location of the clinical evaluation. Performance at the time of testing may vary depending on the variants circulating, including newly emerging strains of SARS-CoV-2 and their prevalence, which changes regularly.

• The results of this test may help limit the potential spread of COVID-19 to your family and others in your community.

• The results of this test may help limit the potential spread of COVID-19 to your family and others in your community.

• If your test is positive, it is likely you have COVID-19.

• If your test is negative, it may not be necessary to follow-up with your healthcare provider.

• False positive results may cause COVID-19 symptoms to persist even when COVID-19 is no longer present. A false positive test result may occur when the test detects viral antigens in the sample when COVID-19 is not present. A false positive test result may be caused by factors such as recent recovery from COVID-19 or the use of medications. If your test is positive, please refer to your healthcare provider for public health reporting.

• In your sample. You should self-isolate from others and contact a healthcare provider for medical advice about your positive result.

• In your sample. You should self-isolate from others and contact a healthcare provider for medical advice about your positive result.

Q: WHAT ARE THE KNOWN AND POTENTIAL RISKS AND BENEﬁTS OF THIS TEST?

Potential risks include:

• Possible discomfort during sample collection

Potential benefits include:

• Results, along with other information, can help you and your healthcare provider make informed recommendations about your care.

Q: WHAT IF I HAVE A POSITIVE TEST RESULT?

• The results of this test may help limit the potential spread of COVID-19 to your family and others in your community.

Q: HOW ACCURATE IS THIS TEST?

• Clinical studies have shown that antigen tests more accurately diagnose COVID-19 than with laboratory-based molecular tests due to the higher sensitivity of antigen tests.

Q: HOW CAN I TELL IF I HAVE A NEGATIVE TEST RESULT?

• A positive test result indicates that antigens from the virus that causes COVID-19 were not detected in your sample. However, if you have symptoms of COVID-19, and your first test is negative, you should test again in 48 hours since antigen tests are not as sensitive as molecular tests. If you do not have symptoms and testing is not needed, you should test at least two more times with 48 hours in between tests for a total of three tests. If you have a negative result, it does not rule out SARSCoV-2 infection; you should still isolate and follow-up with your healthcare provider.

Q: WHAT IF I HAVE A POSITIVE TEST RESULT?

• Clinical studies have shown that antigen tests more accurately diagnose COVID-19 than with laboratory-based molecular tests due to the higher sensitivity of antigen tests.

2 Test/Box – Outer box
The Speedy Swab Rapid COVID-19 Antigen Self-Test is a lateral flow immunoassay that uses antibodies to detect nucleocapsid protein antigen from SARS-CoV-2 in anterior nasal swabs when tested at least three times over five days with at least 48 hours between tests. The test is authorized for individuals with symptoms of COVID-19 within the first 6 days of symptom onset, or individuals without symptoms or other epidemiological reasons to suspect COVID-19.
