

Fiscal Years 2016 – 2022
Office of Infectious Diseases
CARB Research Overview
Department of Health and Human Services
Food and Drug Administration, Silver Spring, MD
October 2022

Public Health Impact:

As bacteria continue to develop resistance, standard treatment can become ineffective and bacterial infections threaten global health. Therefore, there is an urgent need to develop new antibacterial drugs that are active against pathogens associated with antibacterial drug resistance and poor clinical outcomes to improve patient health and well-being worldwide.

FDA's roles in combatting antibacterial drug resistance are to: (1) facilitate the development of new antibacterial drugs to treat patients and (2) advance the science of clinical trial design.

Background:

In March 2015, The National Action Plan for Combating Antibiotic-Resistant Bacteria (CARB) was developed in response to Executive Order 13676: Combating Antibiotic-Resistant Bacteria, which was issued on September 18, 2014. The National Action Plan outlines steps for implementing the National Strategy for Combating Antibiotic-Resistant Bacteria to address urgent and serious drug-resistant threats that affect people in the U.S. and around the world. The updated National Action Plan for 2020 - 2025 continues to outline steps for implementing the National Strategy for Combating Antibiotic-Resistant Bacteria to address urgent and serious drug-resistant threats (bacteria and fungi) that affect people in the U.S. and around the world. Implementation of the National Action Plan will also support World Health Assembly resolution 67.25 (Antimicrobial Resistance), which urges countries to take urgent action at the national, regional, and local levels to combat resistance. FDA/CDER receives funding from Congress on a yearly basis to support CARB related regulatory science research.

To facilitate the development of new antibacterial drugs active against multi-drug resistant bacteria and identify regulatory science research needs, FDA convened the following meetings:

- July 18 - 19, 2016 FDA Public Workshop "Facilitating Antibacterial Drug Development for Patients with Unmet Need and Developing Antibacterial Drugs that Target a Single Species." Meeting materials can be reviewed at:
<http://www.fda.gov/Drugs/NewsEvents/ucm497650.htm>
- March 1, 2017 FDA Public Workshop "Current State and Further Development of Animal Models of Serious Infections Caused by *Acinetobacter baumannii* and *Pseudomonas aeruginosa*." Meeting materials can be reviewed at:
<https://www.fda.gov/Drugs/NewsEvents/ucm534031.htm>.
- April 13, 2017 FDA Advisory Committee Meeting "Developing Antibacterial Therapies Targeting a Single Bacterial Species." Meeting materials can be reviewed at:
<https://www.fda.gov/AdvisoryCommittees/Calendar/ucm551347.htm>.
- June 27, 2018 FDA Public Workshop "Development of Inhaled Antibacterial Drugs for Cystic Fibrosis and Non-Cystic Fibrosis Bronchiectasis." Meeting materials can be viewed at:
<https://www.fda.gov/Drugs/NewsEvents/ucm602331.htm>

- August 21, 2018 FDA Public Workshop “Development of Non-Traditional Therapies for Bacterial Infections.” Meeting materials can be viewed at: <https://www.fda.gov/Drugs/NewsEvents/ucm606052.htm>
- April 18, 2019 “Development of Antibacterial Drugs for the Treatment of Nontuberculous Mycobacterial Disease.” Meeting materials can be reviewed at: <https://www.fda.gov/drugs/development-antibacterial-drugs-treatment-nontuberculous-mycobacterial-disease-04082019-04082019>
- November 18 – 19, 2019 FDA Public Workshop “Enhancing the Clinical Trial Enterprise for Antibacterial Drug Development in the United States.” Meeting materials can be viewed at: <https://www.fda.gov/news-events/fda-meetings-conferences-and-workshops/enhancing-clinical-trial-enterprise-antibacterial-drug-development-united-states-11182019-11192019>
- March 5, 2020 FDA Public Workshop “Advancing Animal Models for Antibacterial Drug Development.” Meeting materials can be viewed at: <https://www.fda.gov/drugs/news-events-human-drugs/advancing-animal-models-antibacterial-drug-development-03052020-03052020>.
- August 4, 2020 FDA Public Workshop “Development Considerations of Antifungal Drugs to Address Unmet Medical Need.” Meeting materials can be viewed at: <https://www.fda.gov/news-events/fda-meetings-conferences-and-workshops/development-considerations-antifungal-drugs-address-unmet-medical-need-08042020-08042020>
- August 5, 2020 FDA Public Workshop “Coccidioidomycosis (Valley Fever): Considerations for Development of Antifungal Drugs.” Meeting materials can be viewed at: <https://www.fda.gov/news-events/fda-meetings-conferences-and-workshops/coccidioidomycosis-valley-fever-considerations-development-antifungal-drugs-08052020-08052020>
- September 25, 2020 FDA Public Workshop “Addressing Challenges in Inhaled Antifungal Drug Development.” Meeting materials can be viewed at: <https://www.fda.gov/drugs/news-events-human-drugs/addressing-challenges-inhaled-antifungal-drug-development-09252020-09252020>.
- April 23, 2021 FDA Public Workshop “Development Considerations of Antimicrobials Drugs for the Treatment of Gonorrhea.” Meeting materials can be viewed at: <https://www.fda.gov/drugs/news-events-human-drugs/development-considerations-antimicrobial-drugs-treatment-gonorrhea-04232021-04232021>
- June 3, 2022 FDA Public Workshop “Development Considerations of Antimicrobial Drugs for the Treatment of Uncomplicated Urinary Tract Infections (UTI).” Meeting materials can be viewed at: <https://www.fda.gov/drugs/news-events-human-drugs/development-considerations-antimicrobial-drugs-treatment-uncomplicated-urinary-tract-infections-uti>
- August 30, 2022 FDA & CDC Public Workshop “Drug Development Considerations for Prevention of Health-Care Associated Infections.” Meeting materials can be viewed at: <https://info.rescueagency.com/en-us/drug-development-consideration-virtual-public-workshop-cdc-fda>

FDA CARB Research Priorities

To help stimulate development programs for antibacterial drugs where limited resources or a lack of incentives is preventing the development of new antibacterial drugs, FDA has identified research areas where regulatory science can support new antibacterial drug development in general. These areas include:

- Evaluate potential innovations in clinical trial design for new antibacterial drugs such as enrollment strategies, data collection streamlining, drug development tools, clinical endpoints, and new statistical analytic approaches
- Advance the science of *in-vitro*, animal model, and/or pharmacokinetic studies to facilitate antibacterial drug development, including studies focused on drug development for special populations such as patients with unmet need, children and patients with renal or hepatic dysfunction.
- Evaluate strategies to enrich enrollment in clinical trials for new antibacterial drugs such as the use of rapid diagnostic tests
- Advance the science of antibacterial drug susceptibility testing.

Consistent with the CARB goals in the area of unmet medical need, fiscal years 2016 - 2022 research focuses on: (1) animal model development or animal model refinement for serious infections caused by *Acinetobacter baumannii* or *Pseudomonas aeruginosa*, (2) understanding the market size for antibacterial drugs, (3) understanding the human gut and lung microbiome, (3) developing and qualifying a Patient Reported Outcome (PRO) for Non-Cystic Fibrosis Bronchiectasis (NCFB), (4) understanding the development and use of clinical practice guidelines for infectious diseases, (5) advancing the science of drug susceptibility testing to ensure that up to date susceptibility testing criteria (breakpoints) are available for patient care, (6) developing PROs for non-tuberculous mycobacterial (NTM) disease and coccidioidomycosis, (7) evaluating the impact of extended-infusion of β -lactam antibiotics on patient outcomes and the development of resistance, and (8) optimizing antimicrobial dosing strategies for populations at high risk for treatment failure.

Project Descriptions for Ongoing CARB Research Studies

Understanding Markets for Antibacterial Drug Development

- Interagency Agreement between FDA and HHS Office of the Assistant Secretary for Planning and Evaluation (FY18: 224183013S; FY19: 75F40119S30008)
- The goals of the project are to understand the: (1) market for antibacterial drugs, (2) incentives for developing new antibacterial drugs, and (3) social value of developing new bacterial drugs.
- The project aims are to: (1) undertake a comparison of the development and production costs, clinical value, and market performance of a cohort of recent antibacterial approvals with an appropriate control group, (2) analyze potential market failures in the antibacterial drug market, and (3) predict future market failure and how to address them.
- Study Outcomes:
 - Poster Presentation: Integrating Existing Metrics to Assess Comparative Real-World Clinical Effectiveness of Recently Approved Antimicrobial Drugs (Academy Health Annual Research Meeting, June 2021, [Link](#))

Development of a Novel PRO Tool for Use in Clinical Trials to Measure Symptoms in Patients with Non-Cystic Fibrosis Bronchiectasis (NCFB) with and without Non-Tuberculous Mycobacterial (NTM) Lung Infection

- Awarded to INSMED, INC (FY19: 1U01FD006687-01)
- The specific aims of this project are to: (1) conduct concept elicitation research to identify the unique symptoms and experience of people diagnosed with NCFB with and without NTM, (2) conduct a non-interventional study in order to validate a novel draft Patient Reported Outcome (PRO) instrument for NCFB, and (3) evaluate the PRO developed in aim 1 to be fit-for-purpose in assessing symptoms among patients with NCFB and NTM and by contrasting the performance of the core PRO between patients diagnosed with NCFB with and without NTM.
- Currently, there are no validated endpoints to advance new therapies for populations with NCFB with or without NTM lung infection. The overall goal of this project is to develop a novel PRO instrument that is advanced to the stage of readiness to be included in a clinical trial to allow qualification for drug development and regulatory decision making in the NCFB field. The qualified PRO could then help design and conduct better clinical trials as well as lead to better interpretation of anti-infective drug trials for NCFB.

Leveraging the Microbiome to Improve Patient Management and Control of Antibiotic Resistance in Cystic Fibrosis Patients.

- Interagency Agreement between FDA and Centers for Disease Control and Prevention (FY20: 75F40120S10020).
- The aims of this study are: 1) Determine the treatment drivers (e.g. drug selection, dosage, and treatment duration) of microbiome disruption and competitive release of resistant *P. aeruginosa* in defined polymicrobial contexts; 2) Determine the drivers of microbiome disruption and competitive release of resistant *P. aeruginosa* in *ex vivo* microbial communities of Cystic Fibrosis (CF) patient sputa; 3) Determine the drivers of competitive release of resistant pathogens in CF patients under antibiotic treatment
- Results from this study will guide understanding on how various antibiotic treatments impact the lung microbiome. Long term, this study will contribute to the development of microbiome indices for antibiotics and a standard approach that prevents adverse events resulting from antimicrobial use, such as the emergence of antibiotic resistant organisms.
- Study Outcomes:
 - Publication: Varga JJ, Zhao CY, Davis JD, Hao Y, Farrell JM, Gurney JR, Voit E, Brown SP. Antibiotics Drive Expansion of Rare Pathogens in a Chronic Infection Microbiome Model. mSphere. 2022 Aug 16:e0031822. doi: 10.1128/msphere.00318-22. Epub ahead of print. PMID: 35972133. ([Link](#))

Development of Rabbit Animal Models of Ventilator-Associated Bacterial Pneumonia Produced by Carbapenem-Resistant *Pseudomonas aeruginosa* and *Acinetobacter baumannii*.

- Awarded to Weill Medical College of Cornell University (FY20: 75F40120C00140)
- The objectives of this study are: 1) develop a rabbit model of carbapenem-resistant *P. aeruginosa* VAP, 2) develop a rabbit model of carbapenem-resistant *A. baumannii* VAP, 3) characterize the pulmonary pathophysiology, microbiology, and pharmacology of the rabbit VAP models, 4) investigate one or more new antibacterial agents in the VAP models.

- The study is expected to result in the development of two rabbit models of VAP. Currently, there are no well characterized VAP animal models which use carbapenem-resistant bacterial strains. These rabbit models would provide the nonclinical foundation for future development of antimicrobials against resistant infections.
- This study aligns with section 2.4.2 of the Broad Agency Announcement to advance the science of animal model development to facilitate antibacterial drug development.

Expanded Metabolomic Interrogation of an Intestinal Microbiome Disruption Model.

- Interagency Agreement between FDA and Centers for Disease Control and Prevention (FY 21: 75F40121S30022).
- The overarching goal of this study is to create an experimental culture system that identifies agents that disrupt or protect the human intestinal microbiome. This study expands upon initial successes (FY19, CDC) to identify additional markers of microbiome disruption by monitoring different metabolite types and by using a broader array of disrupting antimicrobial agents. This work will improve system reliability and interpretability, and will distinguish qualitatively different modes of disruption.
- Data from these studies will be important to develop a standard test that predicts adverse events from antimicrobial use. This knowledge will help identify where preventative or restorative interventions, as well as new narrower-spectrum antibiotic development, can help to mitigate risks for patients taking antibiotics

A Critical Look at Cefepime Breakpoints *In Vivo*: An Assessment of Cefepime Activity against Carbapenemase-producing *Enterobacteriales* with Unexpected Cefepime-Susceptibility and Cefepime Susceptible-Dose Dependent Phenotypic Profiles

- Awarded to Hartford Hospital (FY21: 75F40121C00128)
- The overall objective of this study is to advance the science of susceptibility testing and reporting as well as breakpoint determination as it pertains to cefepime activity against bacteria that produce prevalent carbapenemases such as *Klebsiella pneumoniae* carbapenemase (KPC).
- Results from this study will determine the therapeutic implications of administering cefepime when the infecting isolate demonstrates discordance between its genotype and phenotype, as well as provide insights on the appropriate phenotypic test that can resolve this discrepancy when encountered in the clinic.
- This study aligns with section 2.4.4 of the Broad Agency Announcement: advance the science of antibacterial drug susceptibility testing to ensure that up to date susceptibility testing criteria (breakpoints) are available for patient care and antimicrobial stewardship.

Ampicillin-Sulbactam against *Acinetobacter baumannii* infections:

Pharmacokinetic/Pharmacodynamic Appraisal of Current Susceptibility Breakpoints and Dosing Recommendations

- Awarded to Hartford Hospital (FY21: 75F40121C00184)
- The objective of this study is to assess the pharmacokinetics and pharmacodynamics of ampicillin-sulbactam against *A. baumannii* infections in the murine pneumonia model. The outcomes from the infection model will be correlated to the ampicillin-sulbactam *in vitro* susceptibility interpretive criteria (breakpoints) to assess the capability of these breakpoints to predict *in vivo* outcomes.

- This study represents the first comprehensive assessment of the PK/PD of ampicillin-sulbactam against *A. baumannii* infection which aims to provide insights to assess the suitability of the current established breakpoints.
- The study aligns with section 2.4.4 of the Broad Agency Announcement: advance the science of antibacterial drug susceptibility testing to ensure that up to date susceptibility testing criteria (breakpoints) are available for patient care and antimicrobial stewardship.
- Study Outcomes:
 - Oral Presentation: Sulbactam against *Acinetobacter baumannii* Pneumonia: Pharmacokinetic/Pharmacodynamic Appraisal of Current Dosing Recommendation. (IDWeek 2022).

β-lactam Continuous Versus Intermittent Infusion and Associated Bacterial Resistance and Therapy Outcomes in Critically ill Patients with Severe Pneumonia

- Awarded to University of Florida (FY21: 75F40121C00157)
- The goal of this study is to conduct a randomized, controlled clinical trial that aims to identify the benefits and risk of β-lactam continuous versus intermittent infusion in critically ill patient with severe pneumonia caused by gram-negative pathogens who have been admitted to the ICU. The study will compare the clinical, microbiological, and safety outcomes between the two groups of patients.
- This study will attempt to fill a current knowledge gap concerning the development of antimicrobial resistance between different infusion strategies of β-lactam antimicrobials. Results may guide future dosing recommendations of the antimicrobials and help identify patients who could benefit from prolonged infusion to achieve better drug exposure and therapy outcome.
- This study aligns with section 2.4.2 of the Broad Agency Announcement: Advance the science of in-vitro, animal model, pharmacokinetic studies, and/or real- world evidence studies to facilitate drug development, including studies focused on antimicrobial resistance and drug development for special populations such as patients with unmet need, children and patients with renal or hepatic dysfunction

Continuous versus Intermittent Infusions of β-lactam Antibacterial Drugs: Impact on Resistance and Outcomes in Sepsis

- Awarded to The University of Queensland (FY21: 75F40121C00126)
- The aim of this study is to explore the relationship between β-lactam antibacterial exposure (accounting for antibacterial concentration, bacterial susceptibility, and method of administration) and clinical outcomes (e.g., all-cause 90-day mortality, clinical cure at day 14 post-randomization) of sepsis patients observed in the BLING III clinical trial (NCT03213990). This study is a sub-study of the BLING III clinical trial and is a prospective observational study only.
- The goal of this study is to provide data to better understand the optimal dosing method and method of exposure of β-lactam antimicrobials that lead to better clinical outcomes in patients with sepsis.
- This study aligns with section 2.4.2 of the Broad Agency Announcement: Advance the science of in-vitro, animal model, pharmacokinetic studies, and/or real- world evidence studies to facilitate drug development, including studies focused on antimicrobial resistance and drug development for special populations such as patients with unmet need, children and patients with renal or hepatic dysfunction

Evaluating the Impact of Extended-Infusion B-lactam Administration Strategies on Improving Clinical Outcomes and Reducing the Subsequent Emergence of Antimicrobial Resistance

- Awarded to Johns Hopkins University School of Medicine (FY21: 75F40121C00127)
- The overarching objective of this study is to determine whether prolonging the infusion time of B-lactam therapy for the treatment of Gram-negative bloodstream infections improves patient outcomes while reducing the emergence of subsequent resistance to the B-lactam agent initially administered.
- This study will provide needed information regarding the association between extending antibiotic administration and reducing the emergence of resistance. Results from this study may help inform clinicians of treatment strategies to better optimize patient outcomes.
- This study aligns with section 2.4.2 of the Broad Agency Announcement: Advance the science of in-vitro, animal model, pharmacokinetic studies, and/or real- world evidence studies to facilitate drug development, including studies focused on antimicrobial resistance and drug development for special populations such as patients with unmet need, children and patients with renal or hepatic dysfunction

Development of Pulmonary Nontuberculous Mycobacterial Disease Symptom Scale (NTM-SS), Pulmonary NTM Infection

- Awarded to Oregon Health and Science University (FY21: 75F40121C00120)
- The objective of this study is to develop, test, and validate a disease-specific patient-reported outcome (PRO) measure in well-characterized population of patient with NTM
- Clinical trials for NTM treatment have been limited by the lack of validated measures (e.g., PROs) to assess clinical benefit. This study intends to develop a NTM-specific PRO in order to improve clinical trial design and identify more effective treatments for patients with NTM pulmonary disease.
- This study aligns with section 2.4.1 of the Broad Agency Announcement: Evaluate potential innovations in clinical trial design for new drugs such as enrollment strategies, data collection streamlining, drug development tools, clinical endpoints, and new statistical analytic approaches.

Creation and Validation of a Patient Reported Outcome (PRO) Instrument for the Assessment of Health-Related Quality of Life (HRQOL) in Patients with Coccidioidomycosis

- Awarded to F2G, Ltd. (FY21: 75F40121C00145)
- The objective of this study is to develop and validate a PRO measure for the management of chronic disseminated coccidioidomycosis (Valley Fever).
- Currently, there are no well-defined and validated endpoints for use in coccidioidomycosis clinical trials. The PRO instrument under development in this study aims to accurately assess the efficacy of anti-fungal treatments for coccidioidomycosis.
- This study aligns with section 2.4.1 of the Broad Agency Announcement: Evaluate potential innovations in clinical trial design for new drugs such as enrollment strategies, data collection streamlining, drug development tools, clinical endpoints, and new statistical analytic approaches.
- Study Outcomes:
 - Poster Presentation: Developing a Patient-Reported Outcome (PRO) Instrument for Coccidioidomycosis: The Importance of Clinician Feedback. (MSGERC 2022).
 - Accepted Abstract: “Valley Fever is like having an airborne cancer”: The lived experiences of coccidioidomycosis patients examined through online methodologies (ISOQOL 29th Annual Conference 2022).

Advancing Methods to Optimize Antimicrobial Dosing in Patients with Obesity

- Awarded to University of Michigan (FY22: 7540122C00147)
- The overall objective of this study is to develop new strategies for antimicrobial dose selection in patients with obesity. This study will: 1) establish a vancomycin pharmacomorphic model using data from a large cohort of infected patients with obesity and CT scans, and 2) compare alternate vancomycin dosing regimens based on population PK models with morphomic covariates in order to test pharmacomorphic based vancomycin dosing to standard dosing in obese patients.
- Currently, this patient population is vulnerable to underdosing or overdosing of antimicrobials and therefore approaches to determine appropriate dosing is need. Optimization of antimicrobial dosing strategies in these patients may lead to better clinical outcomes and provide clinicians with needed information regarding dosage of antimicrobials in patients with obesity.
- This study aligns with section 2.4.2 of the Broad Agency Announcement: Advance the science of in vitro, animal model, pharmacokinetic studies, and/or real world evidence studies to facilitate drug development, including studies focused on antimicrobial resistance and drug development for special populations such as patients with unmet need, children, and patients with renal or hepatic dysfunction.

Ex Vivo Modeling, Simulation, and In Vivo Pharmacokinetic Validation to Guide Antimicrobial Dosing Recommendations for Patients on Continuous Renal Replacement Therapy

- Awarded to Hartford Hospital (FY22: 75F40122C00130)
- This study aims to improve dosing recommendation for antimicrobials used in patients on continuous renal replacement therapy (CRRT). The objectives of this study are to conduct ex vivo CRRT assessments of cefepime, meropenem, levofloxacin, and micafungin, followed by simulation of dosing regimens for varied clinical CRRT scenarios, and finally validation of exposures in critically ill patients receiving these agents as standard of care while supported by CRRT.
- Currently, labeling for novel antimicrobials rarely include specific dosing recommendations for patients on CRRT. As such, clinicians are left without much guidance on dose selection for treatment. Results from this study may be used to demonstrate a path forward for determining optimized dosage recommendations for new antimicrobials in patients on CRRT.
- This study aligns with section 2.4.2 of the Broad Agency Announcement: Advance the science of in vitro, animal model, pharmacokinetic studies, and/or real world evidence studies to facilitate drug development, including studies focused on antimicrobial resistance and drug development for special populations such as patients with unmet need, children, and patients with renal or hepatic dysfunction.

Development and Validation of CRRT-Specific Beta-Lactam Population Pharmacokinetic Models to Guide Treatment for Patients with Hospital-acquired Pneumonia

- Awarded to Midwestern University (FY22: 75F40122C00134)
- The primary objective of this study is to develop precision dosing models in critically ill patients with HAP requiring CRRT. This will facilitate the development and evaluation of optimal HAP-specific dosing regimens for cefepime in this population.
- Currently in patients with HAP who are critically ill we observe variability in PK. This results in decreased effectiveness of treatments whose effectiveness depends on achieving adequate

PK/PD exposures. Results from this study will lead to the development of validated PK models and accurate dosing guidance to optimize concentrations of cefepime in these patients which may improve clinical outcomes.

- This study aligns with section 2.4.2 of the Broad Agency Announcement: Advance the science of in vitro, animal model, pharmacokinetic studies, and/or real world evidence studies to facilitate drug development, including studies focused on antimicrobial resistance and drug development for special populations such as patients with unmet need, children, and patients with renal or hepatic dysfunction.

Development of Modernized Susceptibility Guidance for Oral Cephalosporin Antimicrobial Agents Using Pharmacometric Approaches

- Awarded to University of Wisconsin (FY22: 75F40122C00128)
- The overall objective of this study is to apply modern pharmacometric approaches in evaluating breakpoints for oral cephalosporins that guide treatment in patients with uncomplicated bacterial infections. The aims of this study include: 1) characterization of contemporary *E. coli* and *S. aureus* MIC distribution for the commonly prescribed cephalosporins, 2) PK/PD characterization of each drug using a validated mouse-thigh model, and 3) identification of candidate breakpoints for each antimicrobial.
- Results of this study will ensure that up to date breakpoints are available, by using modern methods, for clinicians and thereby improve clinician treatment decisions.
- This study aligns with section 2.4.4 of the Broad Agency Announcement: Advance the science of antibacterial drug susceptibility testing to ensure that up to date susceptibility testing criteria are available for patient care and antimicrobial stewardship.

Development of Modernized Susceptibility Guidance for Azithromycin and Ceftriaxone Against *Neisseria Gonorrhoeae* Using Pharmacometric Approaches

- Awarded to Institute for Clinical Pharmacodynamics (FY22: 75F40122C0128)
- The overall objective of this study is to apply a modern pharmacometric-based method to reevaluate current azithromycin and ceftriaxone breakpoints for *N. gonorrhoeae*. Aims of the study include: 1) characterization of azithromycin and ceftriaxone MIC distributions for *N. gonorrhoeae*, 2) PK-PD characterization of azithromycin and ceftriaxone against *N. gonorrhoeae* using a hollow-fiber in vitro infection model, and 3) identify candidate azithromycin and ceftriaxone *N. gonorrhoeae* STIC.
- Results of this study will ensure that up to date breakpoints are available for clinicians when treating patients with uncomplicated gonorrhea thereby improving clinician treatment decisions.
- This study aligns with section 2.4.4 of the Broad Agency Announcement: Advance the science of antibacterial drug susceptibility testing to ensure that up to date susceptibility testing criteria are available for patient care and antimicrobial stewardship.

A modified susceptibility testing protocol for predicting polymyxin in vivo efficacy

- Awarded to University of Southern California (FY22: 75F40122C00138)
- The main objective of this study is to determine whether MIC testing using the standard culture media (MHII) or RPMI broth better predicts in vivo antibacterial efficacy. Specific aims of this study include: 1) determine the MICs for colistin and polymyxin b using the standard culture medium (MHII) or RPMI, and 2) validate the in vivo predictive efficacy of MICs determined in

either MHII or RPMI media using a human equivalent dosing regimen in an *A. baumannii* mouse model of infection.

- Results of this study will ensure that accurate susceptibility testing methods are available to correctly predict polymyxin b treatment outcomes.
- This study aligns with section 2.4.4 of the Broad Agency Announcement: Advance the science of antibacterial drug susceptibility testing to ensure that up to date susceptibility testing criteria are available for patient care and antimicrobial stewardship.

Development of Modernized Susceptibility Guidance for Oral Sulfamethoxazole-Trimethoprim Using Pharmacometric Approaches

- Awarded to Institute for Clinical Pharmacodynamics (FY22: 75F40122C00174)
- The goal of this study is to apply a modern pharmacometric approach to evaluate sulfamethoxazole-trimethoprim breakpoints for *K. pneumoniae* and *E. coli* arising from uncomplicated urinary tract (uUTI) infections.
- Results of this study will ensure that up to date breakpoints are available for clinicians when treating patients with uUTI.
- This study aligns with section 2.4.4 of the Broad Agency Announcement: Advance the science of antibacterial drug susceptibility testing to ensure that up to date susceptibility testing criteria are available for patient care and antimicrobial stewardship.

Understanding Methodological and Data Challenges to Estimating the Health and Economic Burden of Antimicrobial Resistance

- Interagency Agreement between FDA and HHS Office of the Assistant Secretary for Planning and Evaluation (FY22: 75F40122S30010).
- The objective of this study is to better understand current challenges when estimating the burden of AMR to better guide action to improve future AMR burden estimates. This study builds upon ASPE's ongoing FY18 and FY19 studies. The current FY22 study will provide a comprehensive summary of the current methods for estimating the future health and economic burden of AMR. The review will consider existing data and methodological limitations for generating estimates of AMR burden and identify potential avenues for addressing these limitations.
- Results of this study will lead to more accurate AMR burden calculation in the future. This will guide the U.S. Government's effort to combat AMR and effectively plan for and improve patient care in the future.

Identify Metabolomic Features Shared by *in vitro* and *in vivo* Human Intestinal Microbiome Disruption

- Interagency Agreement between FDA and the Centers for Disease Control and Prevention (FY22: 75F40122S30012).
- The overarching goal of this study is to create an experimental culture system that characterizes the intestinal microbiome disruption potential of antibiotic, probiotic, pharmacologic, and dietary agents. The current prototype system tracks multiple metabolite biomarkers of disruption in a static vial reactor system (SVRS) culture. The objective of this this project is to validate these biomarkers by monitoring them in human subjects with and without antibiotic-mediated disruption.
- This work will yield an SVRS protocol that confirms characteristics of *in vivo* microbiome disruption in humans exposed to antimicrobials. With this confirmation, future studies can solely focus on and investigate markers of disruption that are relevant to humans.

Assessment of the Impact of the IDSA Guidance for the Treatment of Gram-Negative Infection on Use of New Antibiotics in U.S. Healthcare Facilities

- Interagency Agreement between FDA and the National Institutes of Health (FY22: 75F40122S30009).
- The objective of this study is to measure the quantitative impacts of the recent IDSA guidance for the treatment of AMR Gram-negative infections on prescribing patterns of new antibiotics in the U.S. The aims of this study are: 1) to assess recent (2019-2022) utilization patterns of new gram-negative active antibiotics at the hospital and patient level, and 2) to describe the trends in utilization of FDA approved gram-negative active antibiotics relative to the publication of the IDSA management guidance at the hospital and patient level using an interrupted time series analysis, controlling for pandemic effect.
- Understanding these trends could inform projections of new antibiotic prescriptions, evaluate the utility of, and need for more nimble guidances for antimicrobial prescribing and the need for higher quality trials, and provide a benchmark response in prescribing behavior that will inform future studies.

Previously Funded Studies:

Development of an Automated and Sustainable Electronic Approach for Data Mining to Evaluate Clinical Outcomes of Patients with Bacterial Infections

- Awarded to Johns Hopkins University School of Medicine (FY16: HHSF223201610070C)
- The objective of this project was to develop the coding needed for the electronic transfer of selected clinical data for patients with gram-negative bacteremia (bloodstream infection) in a commonly used electronic health records (EHR) system. The transferred data populated a database for the evaluation of clinical outcomes considering patient characteristics and antibacterial drug breakpoints (the standards used by laboratories to report susceptibility of bacteria isolated from a patient to different antibacterial drugs).
- This study addressed an important regulatory science priority. The paucity of clinical outcomes data results in increasing reliance upon pharmacokinetic modeling for breakpoint updating with a trend toward lowering breakpoints primarily based on this modeling. The lowering of breakpoints may have stewardship implications as the use of second and third line agents may increase. The availability of this clinical outcome information is expected to be useful in discussions concerning revising breakpoints.
- Study Outcomes:
 - Publication: Fabre V, Amoah J, Cosgrove SE, Tamma PD. Antibiotic Therapy for Pseudomonas aeruginosa Bloodstream Infections: How Long Is Long Enough? Clin Infect Dis. 2019 Nov 13;69(11):2011-2014. doi: 10.1093/cid/ciz223. PMID: 30882137; PMCID: PMC7320076. ([Link](#))
 - Publication: Fox MT, Amoah J, Hsu AJ, Herzke CA, Gerber JS, Tamma PD. Comparative Effectiveness of Antibiotic Treatment Duration in Children With Pyelonephritis. JAMA Netw

Open. 2020 May 1;3(5):e203951. doi: 10.1001/jamanetworkopen.2020.3951. PMID: 32364593; PMCID: PMC7199115. ([Link](#))

- [CDER Impact Story: Exploiting Real-World Data to Optimize the Use of Antibiotics](#); November 2021 ([Link](#)).

Evaluation of the Measurement Properties of Patient-Reported Outcome (PRO) Instruments in Patients with Community-Acquired Bacterial Pneumonia (CABP) and Acute Bacterial Skin and Skin Structure Infections (ABSSSI)

- Awarded to ICON Clinical Research LLC (FY16: HHSF223201610100C)
- The objectives of this contract were to carry out psychometric evaluations of new Patient Reported Outcome (PRO) instruments for Community-Acquired Bacterial Pneumonia (CABP), Hospital-Acquired Bacterial Pneumonia (HABP), and Acute Bacterial Skin and Skin Structure Infection (ABSSSI). These CABP-specific, HABP-specific, and ABSSSI-specific PRO instruments may be submitted for qualification in accordance with both the FDA PRO guidance and the FDA drug development tool (DDT) qualification draft guidance.
- These objectives addressed the improvement of clinical endpoints for antibacterial drug trials listed in the Broad Agency Announcement (FDABAA-17-00123; section 2.4). The overall goals of this project were to develop qualified instruments for each disease that can be used by drug developers for the qualified context of use in IND and NDA/BLA submissions.

Bridging Novel Laboratory Animal and Hollow Fiber Infection Models to Evaluate Central Nervous System Penetration of Drugs in Infants

- Awarded to Duke University (FY16: HHSF223201610082C)
- The overall goal of this project was to develop and evaluate a new paradigm for evaluating CNS penetration of antibacterial drugs in human neonates. The objectives of this project were: (1) develop and validate a rabbit model of CNS infection and define the pharmacodynamics of the antibacterial drugs meropenem and tobramycin for the treatment of meningitis, (2) develop and validate a hollow fiber infection model (HFIM) of neonatal meningitis to characterize the pharmacodynamics of meropenem and tobramycin by evaluating bacterial killing and emergence of antimicrobial resistance, (3) bridge the preclinical results to infants using population PK-PD modeling to guide dosing regimens of meropenem and tobramycin for treatment of meningitis in infants.
- The study may help identify new approaches to study antibacterial drugs in infants, with the goal of obtaining the information needed to label an antibacterial drug for pediatric use more efficiently.
- Study Outcomes:
 - [Poster Presentation](#): Development of an Experimental Model of Bacterial Meningoencephalitis to Facilitate Antimicrobial Drug Development for Neonates. (ESCMID/ASM Conference 2019)
 - [Publication](#): Farrington N, McEntee L, Johnson A, Unsworth J, Darlow C, Jimenez-Valverde A, Hornik C, Greenberg R, Schwartz J, Das S, Hope W. Pharmacodynamics of Meropenem and Tobramycin for Neonatal Meningoencephalitis: Novel Approaches to Facilitate the Development of New Agents to Address the Challenge of Antimicrobial Resistance. *Antimicrob Agents Chemother.* 2022 Apr 19;66(4):e0218121. doi: 10.1128/aac.02181-21. Epub 2022 Mar 22. PMID: 35315689; PMCID: PMC9017387. ([Link](#))

- Oral Abstract: Pharmacodynamics of meropenem and tobramycin for neonatal meningoencephalitis: novel approaches to facilitate the development of new agents to address the challenge of antimicrobial resistance (ECCMID 2022).

Rabbit Models of *Pseudomonas aeruginosa* Acute Pneumonia, Severe Sepsis, and Ventilator-Associated Pneumonia for Novel Antibacterial Development

- Awarded to University of California, San Francisco (FY17: HHSF223201710112C)
- The objectives of this contract were to advance the development of rabbit infection models as a translational approach for testing new drug candidates for the treatment of serious infections caused by *Pseudomonas aeruginosa* in humans.
- This study aligned with section 2.4.2 of the Broad Agency Announcement (FDABAA-17-00123) to advance the science of animal model development to facilitate antibacterial drug development.
- Study Outcomes:
 - Publication: Nguyen NTQ, Gras E, Tran ND, Nguyen NNY, Lam HTH, Weiss WJ, Doan TNM, Diep BA. *Pseudomonas aeruginosa* Ventilator-Associated Pneumonia Rabbit Model for Preclinical Drug Development. *Antimicrob Agents Chemother.* 2021 Jun 17;65(7):e0272420. doi: 10.1128/AAC.02724-20. Epub 2021 Jun 17. PMID: 33972247; PMCID: PMC8218622. [\(Link\)](#)
 - Publication: Aguiar-Alves F, Le HN, Tran VG, Gras E, Vu TTT, Dong OX, Quetz JS, Cheng LI, Yu L, Sellman BR, Stover CK, DiGiandomenico A, Diep BA. Antivirulence Bispecific Monoclonal Antibody-Mediated Protection against *Pseudomonas aeruginosa* Ventilator-Associated Pneumonia in a Rabbit Model. *Antimicrob Agents Chemother.* 2022 Feb 15;66(2):e0202221. doi: 10.1128/AAC.02022-21. Epub 2021 Dec 13. PMID: 34902264; PMCID: PMC8846318. [\(Link\)](#)

Development of a Porcine Model of Ventilator-Associated Pneumonia Caused by *Acinetobacter baumannii*

- Awarded to Lovelace Biomedical & Environmental Research Institute (FY17: HHSF223201710130C)
- The objective of this contract was to advance the development of porcine infection models as a translational approach for testing new drug candidates for the treatment of serious infections caused by *Acinetobacter baumannii* in humans.
- This study aligned with section 2.4.2 of the Broad Agency Announcement (FDABAA-17-00123) to advance the science of animal model development to facilitate antibacterial drug development.

A Preclinical Mouse Model of *Acinetobacter baumannii* Infection for Antibacterial Development

- BAA contract awarded to University of Southern California (FY17: HHSF223201710199C)
- The project is aimed at refinement of an established mouse model of *Acinetobacter baumannii* pneumonia and bacteremia infection.
- This study aligns with section 2.4.2 of the Broad Agency Announcement to advance the science of animal model development to facilitate antibacterial drug development.
- Study Outcomes:

- **Publication:** Nielsen TB, Yan J, Luna B, Spellberg B. Murine Oropharyngeal Aspiration Model of Ventilator-associated and Hospital-acquired Bacterial Pneumonia. *J Vis Exp.* 2018 Jun 28;(136):57672. doi: 10.3791/57672. PMID: 30010650; PMCID: PMC6102004. ([Link](#))
- **Publication:** Luna BM, Yan J, Reyna Z, Moon E, Nielsen TB, Reza H, et al. (2019) Natural history of *Acinetobacter baumannii* infection in mice. *PLoS ONE* 14(7): e0219824. <https://doi.org/10.1371/journal.pone.0219824> ([Link](#))
- **Publication:** Luna B, Trebosc V, Lee B, Bakowski M, Ulhaq A, Yan J, Lu P, Cheng J, Nielsen T, Lim J, Ketphan W, Eoh H, McNamara C, Skandalis N, She R, Kemmer C, Lociuoro S, Dale GE, Spellberg B. A nutrient-limited screen unmasks rifabutin hyperactivity for extensively drug-resistant *Acinetobacter baumannii*. *Nat Microbiol.* 2020 Sep;5(9):1134-1143. doi: 10.1038/s41564-020-0737-6. Epub 2020 Jun 8. PMID: 32514072; PMCID: PMC7483275. ([Link](#))

Development of a Mouse Model for Preclinical Screening of Investigational Drugs Against *Pseudomonas aeruginosa*

- BAA contract awarded to University of Louisville School of Medicine (FY18: HHSF22320180171C)
- The project aim is: (1) to validate this model against multiple *P. aeruginosa* isolates with different drug resistance profiles by establishing the LD₅₀ and natural history for each isolate and (2) to establish dosing parameters for two control antibiotics using PK/PD analysis/models so that these antibiotics can be used as controls/comparators to better gauge the efficacy of novel investigational drugs against *P. aeruginosa*.
- This study aligns with section 2.4.2 of the Broad Agency Announcement (to advance the science of animal model development to facilitate antibacterial drug development).
- Study Outcomes:
 - **Publication:** Warawa JM, Duan X, Anderson CD, Sotsky JB, Cramer DE, Pfeffer TL, Guo H, Adcock S, Lepak AJ, Andes DR, Slone SA, Stromberg AJ, Gabbard JD, Severson WE, Lawrenz MB. Validated Preclinical Mouse Model for Therapeutic Testing against Multidrug-Resistant *Pseudomonas aeruginosa* Strains. *Microbiol Spectr.* 2022 Sep 12:e0269322. doi: 10.1128/spectrum.02693-22. Epub ahead of print. PMID: 36094219. ([Link](#))

Estimating the National Market Size for Novel Gram-negative Active Agents

- Interagency Agreement between FDA and National Institutes of Health (FY18: 224183008S)
- Project aims were: (1) quantify the opportunities for empiric and targeted antibacterial therapy for patients within the *Cerner Healthfacts* dataset with infections secondary to Gram-negative (GN) isolates displaying resistance to: (a) all first-line treatment options including carbapenems where novel agents with superior efficacy and toxicity profiles would be optimal and (b) extended-spectrum cephalosporins for which new carbapenem-sparing agents could be utilized and (2) work collaboratively with HHS economists to generate national market projections for novel agents that either spare carbapenems or retain activity when existing first-line gram-negative active agents remain inactive.
- This study will provide an understanding of the real-world market size for new agents with activity against resistant GN pathogens with limited treatment options could inform appropriate use,

mitigate over-reliance on carbapenems, and ensure balance in aligning both incentives and investments.

- Study Outcomes:
 - Poster Presentation: Estimating the Need for Novel Gram-Negative Active Antibiotics in US Hospitals (IDWeek 2019) ([Link](#))
 - Oral Presentation: Difficult-to-Treat Resistance (DTR) as a Metric to Quantify the Need for Novel Gram-Negative Antibiotics in US Hospitals (OND Extramural Research Science Day, September 2, 2020).
 - Publication: Strich JR, Warner S, Lai YL, Demirkale CY, Powers JH 3rd, Danner RL, Kadri SS. Needs assessment for novel Gram-negative antibiotics in US hospitals: a retrospective cohort study. *Lancet Infect Dis.* 2020 Oct;20(10):1172-1181. doi: 10.1016/S1473-3099(20)30153-5. Epub 2020 Jun 4. PMID: 32505231; PMCID: PMC7272178. ([Link](#))

MIC Breakpoints

- Interagency Agreement between FDA and National Institutes of Health (FY19: 75F40119S30002; FY20: 75F40120S30046)
- The project aims are to: (1) develop an approach using *Cerner Healthfacts* dataset to determine whether there is a correlation between patients stratified by existing *in vitro* MIC breakpoints and those stratified by clustering of risk-adjusted clinical outcome, (2) identify the strengths and limitations of this approach, and (3) compare findings from this approach with any relevant published literature concerning MIC breakpoints for the same drug-bug combination analyzed.
- The FY20 study will focus the MIC breakpoints and clinical outcomes analysis on *Stenotrophomonas maltophilia* and various relevant antimicrobial agents.
- The expected outcome from this study is an adjusted odds ratio of in-hospital mortality stratified by existing MIC breakpoints. Data from this study will help to further define the relationship between MIC breakpoints and risk-adjusted clinical outcomes.

Natural Language Processing (NLP) of Electronic Health Records (EHRs) to Advance Understanding of Antimicrobial Resistance (AMR)

- Awarded a Task Order to the MITRE Corporation (FY19: 75F40119F80474).
- This proof of concept study aimed to: (1) demonstrate a tightly focused application of Natural Language Processing (NLP) on a set of Electronic Health Records (EHRs) using a database to understand the utility of NLP analysis of EHRs for antimicrobial resistance (AMR) relevant information, (2) conduct NLP that analyzes unstructured notes in EHRs, such as anonymized hospital admission and discharge notes, and assess whether we can train the machine to recognize in notes that certain events took place, such as a patient had an abscess drained or had infected hardware removed from their body.
- The purpose of this study was to conduct a NLP proof of concept study on a single topic (i.e., source control) and a single use case to assess the benefits and limitations of NLP in automating analysis of information relevant to AMR in EHRs. This information will be the basis to build a full NLP annotation study in the future.

A Human Microbiome Disruption Model

- Interagency Agreement between FDA and Centers for Disease Control and Prevention
- In FY19 (75F40119S30012), CDC will continue to support studies to understand the microbiome disruption potential for antibiotics. Specifically, CDC will fund a study, using both FDA-CDER IAA and CDC AR funds to identify and validate biomarkers of microbiome disruption in a microbiome model to measure antimicrobial disruption of gastrointestinal (GI) microbiome. This project will advance the science of measuring antibiotic-specific human microbiome disruption.
- Data from these studies will be important to develop a standard test that predicts adverse events from antimicrobial use. This knowledge will help identify where preventative or restorative interventions, as well as new narrower-spectrum antibiotic development, can help to mitigate risks for patients taking antibiotics.

Development of Modernized *Acinetobacter baumannii* Susceptibility Guidance for Recommended Antimicrobial Agents using Pharmacometric Approaches.

- Awarded to the University of Wisconsin System (FY20: 75F40120C00111)
- The overall objective for this study is to characterize the contemporary *A. baumannii* minimum inhibitory concentration (MIC) for various antibiotics (e.g., minocycline, ciprofloxacin, etc.). The study will characterize PK-PD of each antibiotic using validated mouse-thigh and mouse-lung infection models and to identify candidate STIC for each antibiotic by integrating animal model-derived PK-PD relationships and PK model-derived human exposures through Monte Carlo simulation in the context of contemporary MIC distribution data.
- The results of this study will improve clinical guidance for the care of patients suffering with multi-drug resistant *A. baumannii* infections.
- This study aligns with section 2.4.4 of the Broad Agency Announcement: advance the science of antibacterial drug susceptibility testing to ensure that up to date susceptibility testing criteria (breakpoints) are available for patient care and antimicrobial stewardship.

Pharmacodynamics of Minocycline, Levofloxacin, and Trimethoprim/Sulfamethoxazole Against *Stenotrophomonas maltophilia*: Implications for Susceptibility Breakpoint Revisions.

- Awarded to the Hartford Hospital (FY20: 75F40120C00171)
- The overall objective for this study is to determine the *in vivo* pharmacodynamics of minocycline and levofloxacin and *in vitro* pharmacodynamics of trimethoprim/sulfamethoxazole against clinically representative *S. maltophilia*. This study will support the assessment of susceptibility breakpoints for these antibiotics against *S. maltophilia*.
- The results of this study may assist in revising or updating the current susceptibility breakpoints for certain antibiotics against *S. maltophilia*.
- This study aligns with section 2.4.4 of the Broad Agency Announcement: advance the science of antibacterial drug susceptibility testing to ensure that up to date susceptibility testing criteria (breakpoints) are available for patient care and antimicrobial stewardship.
- Study Outcomes:
 - Poster Presentation: Levofloxacin pharmacodynamics against *Stenotrophomonas maltophilia* in a neutropenic murine thigh infection model: implications for susceptibility breakpoint revision (World Microbe Forum 2021).
 - Oral Abstract: *In Vivo* Efficacy of Human Simulated Minocycline against *Stenotrophomonas maltophilia* (IDWeek 2021).

- Poster Presentation: Minocycline Pharmacodynamics against *Stenotrophomonas maltophilia* in a Neutropenic Murine Thigh Infection Model (IDWeek 2021).
- Publication: Fratoni AJ, Nicolau DP, Kuti JL. Levofloxacin pharmacodynamics against *Stenotrophomonas maltophilia* in a neutropenic murine thigh infection model: implications for susceptibility breakpoint revision. *J Antimicrob Chemother.* 2021 Dec 24;77(1):164-168. doi: 10.1093/jac/dkab344. PMID: 34542637. ([link](#))
- Publication: Fratoni AJ, Nicolau DP, Kuti JL. Minocycline pharmacodynamics against *Stenotrophomonas maltophilia* in the neutropenic murine infection model: implications for susceptibility breakpoints. *J Antimicrob Chemother.* 2022 Mar 31;77(4):1052-1060. doi: 10.1093/jac/dkac018. PMID: 35134195. ([Link](#))
- Publication: Lasko MJ, Gethers ML, Tabor-Rennie JL, Nicolau DP, Kuti JL. *In Vitro* Time-Kill Studies of Trimethoprim/Sulfamethoxazole against *Stenotrophomonas maltophilia* versus *Escherichia coli* Using Cation-Adjusted Mueller-Hinton Broth and ISO-Sensitest Broth. *Antimicrob Agents Chemother.* 2022 Mar 15;66(3):e0216721. doi: 10.1128/aac.02167-21. Epub 2022 Jan 10. PMID: 35007135; PMCID: PMC8923228. ([Link](#))
- Publication: Lasko MJ, Tabor-Rennie JL, Nicolau DP, Kuti JL. Trimethoprim/sulfamethoxazole pharmacodynamics against *Stenotrophomonas maltophilia* in the in vitro chemostat model. *J Antimicrob Chemother.* 2022 Sep 14;dkac304. doi: 10.1093/jac/dkac304. Epub ahead of print. PMID: 36101486. ([Link](#))

Expanding Current and Future Susceptibility Testing Criteria with Genotypic Data: Comparative Efficacy of Human-Simulated Exposures of Ceftazidime/Avibactam, Imipenem/Relebactam, and Meropenem/Vaborbactam against Oxa-48- β -lactamase-Producing Enterobacterales in the Neutropenic Murine Thigh Infection Model.

- Awarded to the Hartford Hospital (FY20: 75F40120C00152)
- The study aims to advance the field of susceptibility breakpoint determination by assessing the contribution of bacterial genotype to antibiotic efficacy. Current breakpoint decisions are made based primarily on the MIC phenotype. This study will utilize genotypic profiles, phenotypic MIC testing, and a neutropenic murine (mouse) thigh infection model to determine whether genotypic information should be considered as part of the antibiotic breakpoint determination package.
- The results of this study may help guide utilization practices for relevant antibiotics such as meropenem-vaborbactam, ceftazidime-avibactam, or imipenem-relebactam when treating resistant infections.
- This study aligns with section 2.4.4 of the Broad Agency Announcement: advance the science of antibacterial drug susceptibility testing to ensure that up to date susceptibility testing criteria (breakpoints) are available for patient care and antimicrobial stewardship.
- Study Outcomes:
 - Poster Presentation: Phenotypic assessment of carbapenem and carbapenem/ β -lactamase inhibitor activity against OXA-48-producing Enterobacterales: The challenge of variable hydrolysis and definitive breakpoints (World Microbe Forum 2021).
 - Publication: Asempta TE, Kois AK, Gill CM, Nicolau DP. Phenotypes, genotypes and breakpoints: an assessment of β -lactam/ β -lactamase inhibitor combinations against OXA-

48. J Antimicrob Chemother. 2022 Mar 23;dkac074. doi: 10.1093/jac/dkac074. Epub ahead of print. PMID: 35325165. ([Link](#))

Metallo- β -Lactamase (MBL) Resistance in Enterobacterales: Is It Time to Rethink our In Vitro

Assessment Tools?

- Awarded to the Hartford Hospital (FY20: 75F40120C00164)
- The study aims to assess whether carbapenem therapy can be utilized to effectively manage serious infections due to MBL-producing *Enterobacterales*. This will be achieved by evaluating the effect that zinc concentrations may have on the MIC interpretation of the activity of carbapenems. It has been observed that conventional susceptibility testing, using conventional culture media, may impair the interpretation of the activity of carbapenems against MBL-producing *Enterobacterales*. This has been attributed to the higher zinc concentration in conventional culture media as compared to the zinc levels present *in vivo*.
- This study may result in the modification or refinement of the current methods for *in vitro* antimicrobial susceptibility testing and the protocols for the selection of effective treatment for patients with MBL-producing *Enterobacterales* infections.
- This study aligns with section 2.4.4 of the Broad Agency Announcement: advance the science of antibacterial drug susceptibility testing to ensure that up to date susceptibility testing criteria (breakpoints) are available for patient care and antimicrobial stewardship.
- Study Outcomes:
 - Oral Presentation: Efficacy of B-lactam Therapy against Infections Caused by Metallo-B-lactamase (MBL)-Producing Enterobacterales: Bridging the Susceptibility Testing Gap (IDWeek 2022).

Understanding the Development and Use of Clinical Practice Guidelines for Infectious Diseases.

- Interagency Agreement between FDA and HHS Office of the Assistant Secretary for Planning and Evaluation (FY 20, FY 21: 75F40120S30020).
- In FY 20 the study aims include: 1) explore how to support evidence-based clinical practice in the treatment of antibiotic-resistant infectious disease, 2) address knowledge gaps around the effective development and updating of clinical practice guidelines.
- In FY 21 ASPE plans to finish analysis and disseminate results from the study at a public stakeholder meeting and also through peer-reviewed publication.
- This study will explore considerations that may make the treatment of resistant infections different than other areas of clinical practice. Furthermore, the study may lead to more effective development of antibacterial treatment guidelines by exploring best practices used during treatment guideline development. More effective treatment guidelines for infectious diseases would positively affect patient outcomes.
- Study Outcomes:
 - Public Webinar: Developing Sound, Timely, and Useful Infectious Disease Guidelines: Experts Share What They've Learned (June 23, 2022; [Link](#))
 - Accepted Manuscript: Powell RE, Felt-Lisk S, Chen A, Sullivan C. Optimizing clinical practice guidelines to address antimicrobial-resistant infections: a conceptual framework reflecting stakeholder perspectives. Antimicrobial Stewardship & Healthcare Epidemiology. 2022. *Accepted*

Assessment of Residual Needs for Novel Gram-negative Active Agents: A Real-world Post-Approval Pharmacoepidemiologic Analysis, U.S. Hospital, 2019-2020

- Interagency Agreement between FDA and National Institutes of Health (FY 21: 75F40121S30021).
- This study will aim to confirm and validate previous work conducted (FY18, NIH) by using the Premier Inc. database. Study Aims include: 1) quantify the opportunities for empiric and targeted treatment with antibacterial therapy for inpatients between 2019-2020 with suspected or confirmed infections secondary to Gram-negative isolates displaying high level resistance, 2) Assess the impact of the FDA approved gram-negative active antibiotics since 2015 with activity against carbapenem-resistant gram-negative infections on current market estimates.
- This study will provide information to help better understand the current landscape for novel gram-negative antibiotics during 2019-2020 and assess the impact of recently approved antibiotics on potential future market size.
