Why Innovate?

Innovation

- What is it?
 - a new or changed entity realizing or redistributing value.
- How do we inspire it?
 - create an environment conducive to creativity.
 - demonstrating curiosity, autonomy, risk-taking, creativity, and collaboration in our work.

National Center for Toxicological Research (NCTR)

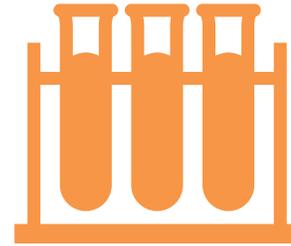

Jefferson, Arkansas

Research at NCTR

Vision: Conduct scientific research to provide reliable data for FDA's decision-making and develop innovative tools and approaches that support FDA's public health mission.

NCTR has 6 research divisions with focus areas:

Artificial Intelligence and Machine Learning (AI/ML)

Biomarker Identification

Bio-Imaging

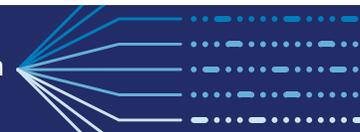

Nanotechnology

Molecular Toxicology

One Health

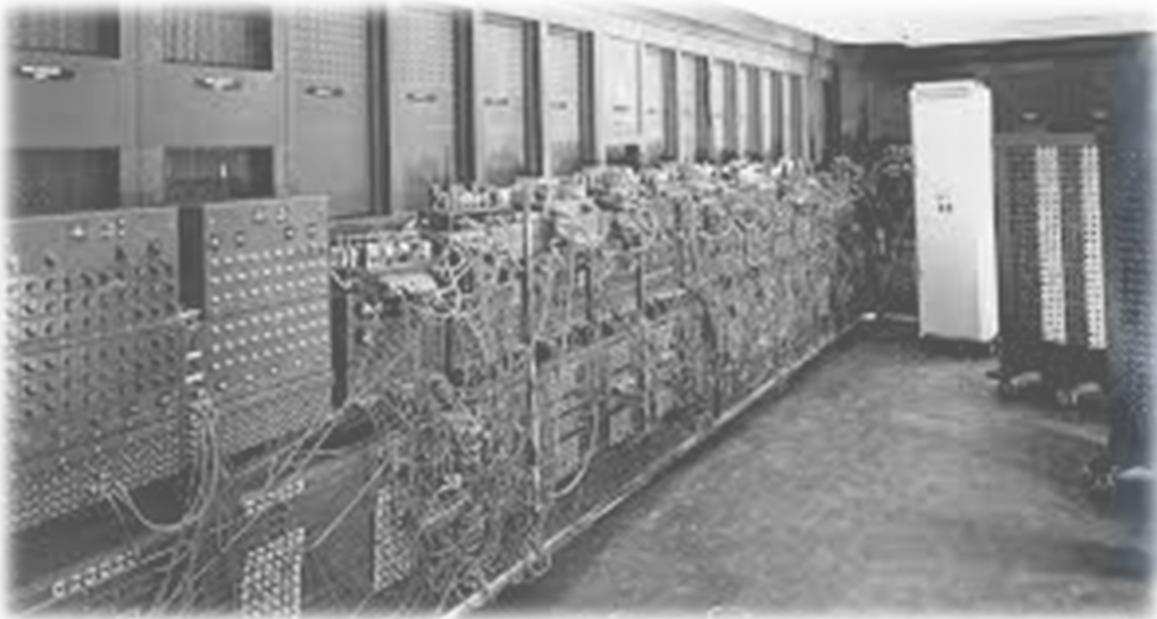

Perinatal and Maternal Health Research

Precision Medicine

Challenges

How long does it take to find information?

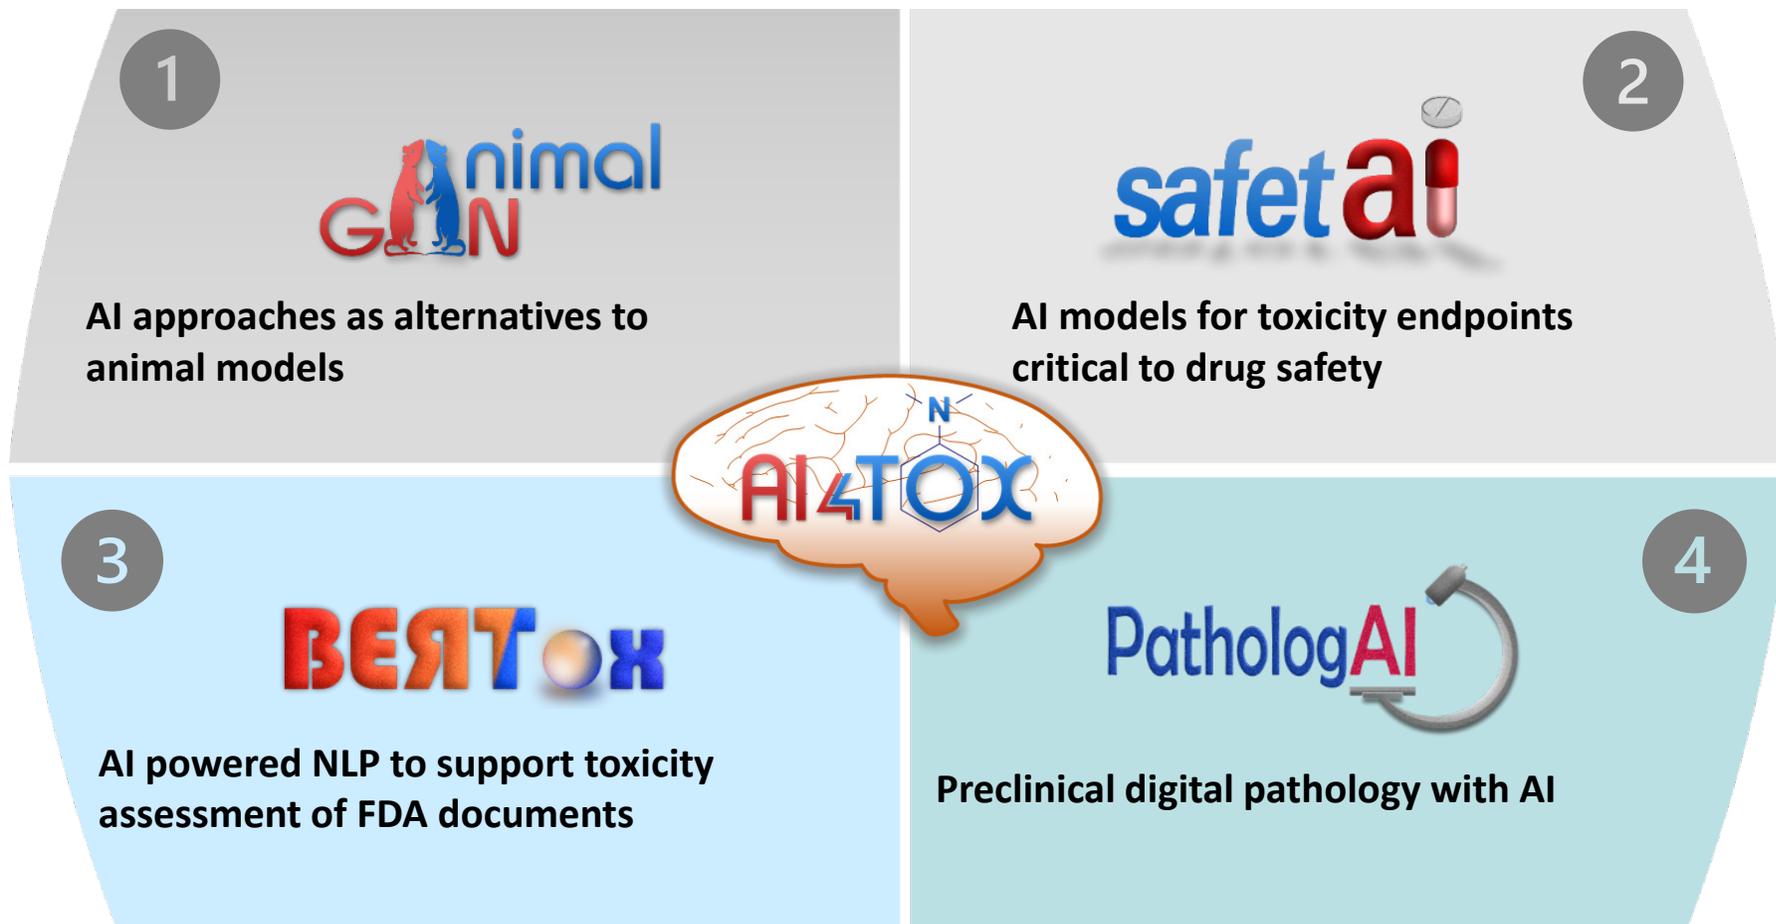

How do we seek out new sources of information?

How do we best use our research time?

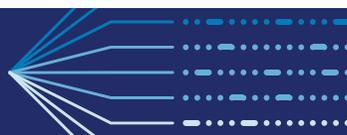

- searching for information or evaluating the most relevant information?

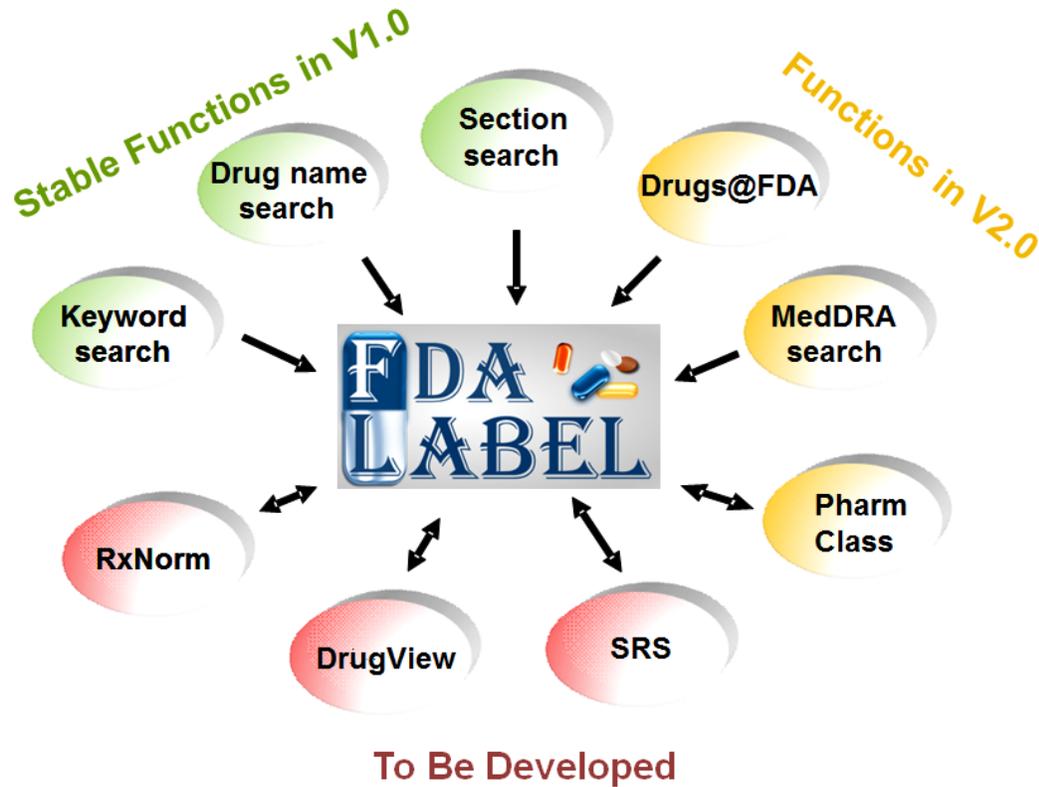

AI for Toxicology (AI4TOX) Program at NCTR

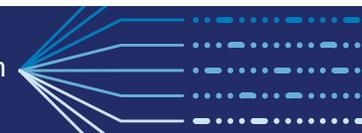

<https://www.fda.gov/about-fda/nctr-research-focus-areas/artificial-intelligence>

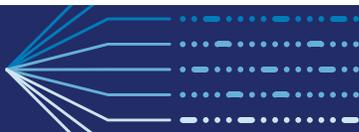

- A web-based database for managing, querying and organizing drug labeling and other product labeling
 - User-friendly interface that searches against the entire text of drug labeling
- Actively used by CDER reviewers
- Used also by researchers from the public
- Integrated with other FDA resources such as Drugs@FDA, OrangeBook, and PurpleBook
- Weekly update (currently with >140,000 labeling)

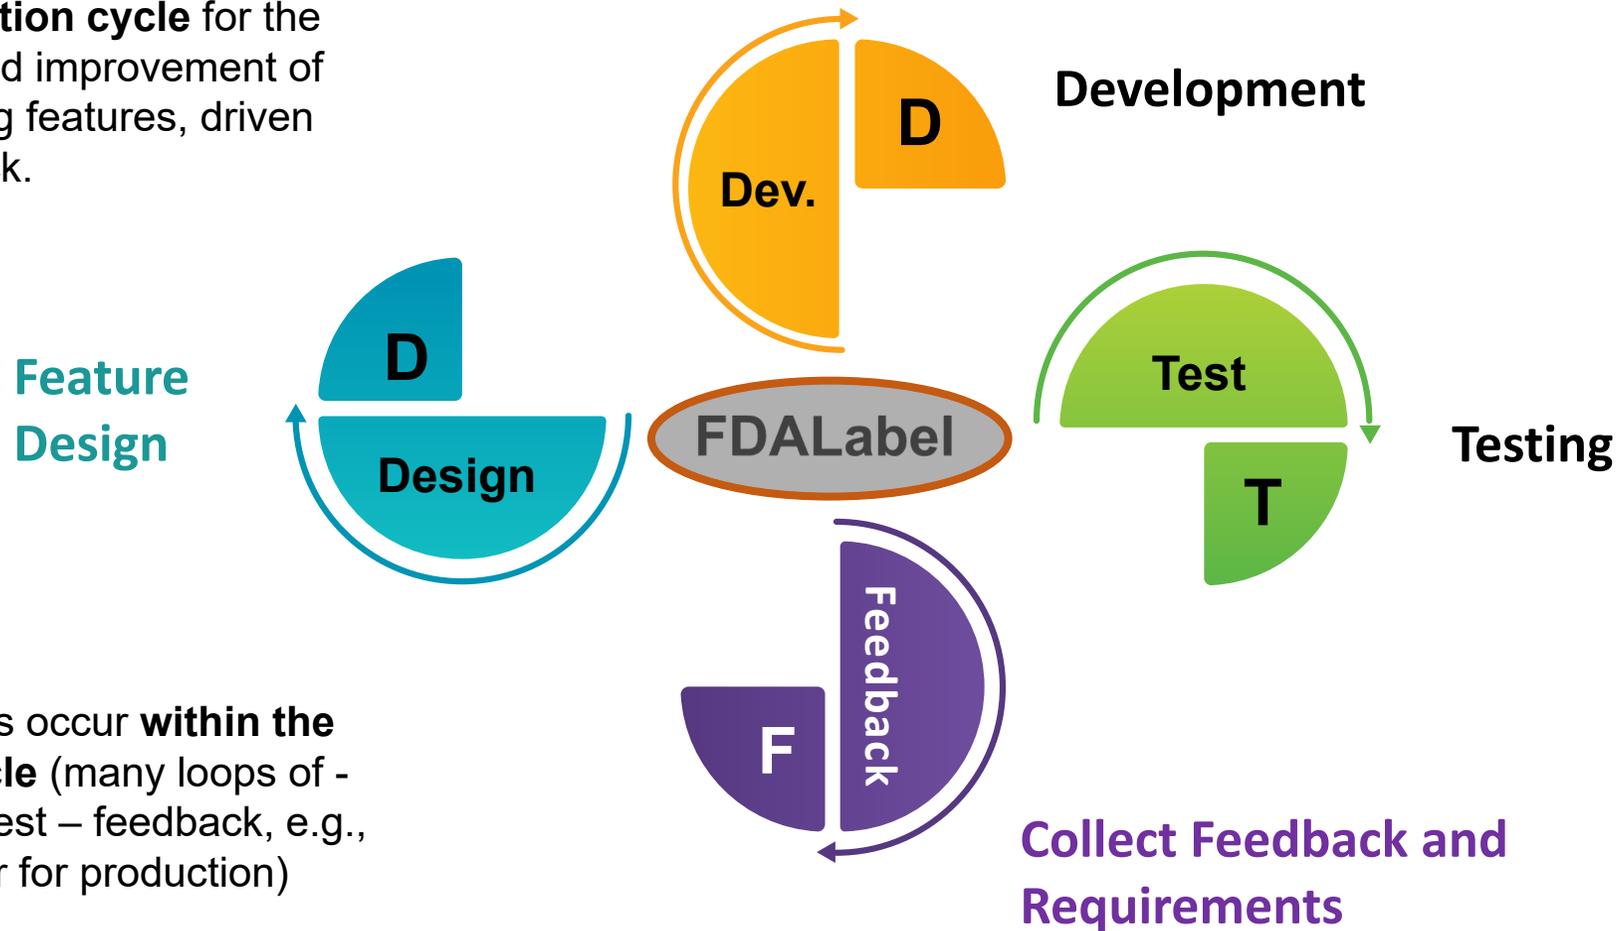

Please check out FDALabel **on Amazon Cloud**: <https://nctr-crs.fda.gov/fdalabel/ui/search>

How is FDALabel Developed?

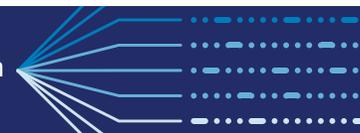

Annual production cycle for the development and improvement of new and existing features, driven by user feedback.

Additional cycles occur **within the production cycle** (many loops of - development - test – feedback, e.g., 4 times this year for production)

Why FDALabel?

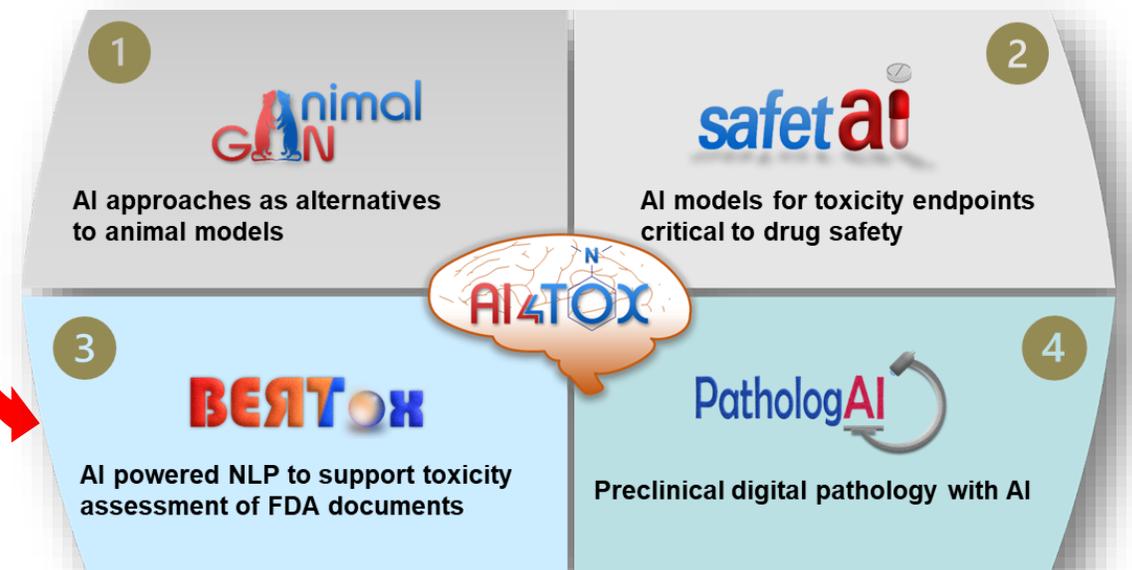

- FDA Drug labeling is one of the important documents to support the review and study adverse events of drugs
 - We initially developed a pilot to support our study of drug induced liver injury (DILI)
- Challenges presented by drug labeling data including
 - Rapid growth of drug labeling data
 - Major format change in 2006, many sections and subsections
 - Complex relationship between drug products
- Need a flexible, powerful, and fast tool to manage and search over the entire text or specific sections with the awareness of relationships
 - Timely updating and repeated use with complex queries
 - Create and save customized queries for sharing and later viewing
 - Flexible combination of various search options

Next Step: AI for FDALabel

- RxBERT with improved functionalities for FDALabel
 - Developed based on the most advanced AI for Natural Language Processing (NLP) algorithm, called BERT (developed by Google).
 - Customized domain-specific BERT model that was trained using human prescription drug labeling documents.
 - Provides a Google-like searches in FDALabel.
 - Enhances text search and improves adverse events recognition

RxBERT is a part of BERTox initiative

Collaboration with CDER

>10 yrs in collaboration

- **DASH** (Data Analysis Search Host) to record a drug's lifecycle of IND → NDA or BLA (CDER/OTS)
- **Smart Template System** to enable the automated capture of findings during the review process (MOU with CDER/OCS)
- **FDALabel** to facilitate review application of drug labeling documents (Led by NCTR/OSC, MOU with CDER/OCS)

Other projects

- CDER/OND - Develop a DASH-like system to support FDA Safety Policy Research Team (SPRT)
- CDER/OCS – Develop SafetAI initiative to support 30-day drug safety review
- CDER/OCP - Organize findings from biosimilar submissions to support biosimilarity assessment
- CDER/OSE - AI4PharmcoVig, an AI model for document screening, classification, and processing to enhance pharmacovigilance
- ...

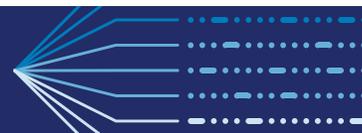

Collaboration with FDA Centers

ORA

- **ALIS:** Automated Laboratory Information System to manage laboratory data generated during the ORA review process (completed last year)

CTP

- **ASSIST4Tobacco:** An Artificial Intelligence (AI)-based information retrieval system (completed the first phase of the project)
