

Analytical Results for Arsenic in Infant Formula (FY2023-2025)

The data in this table represent 312 samples of infant formulas tested in FY2023-2025 as part of a special survey.

[a] Powders, Ready-to-Feed Liquids, and Concentrated Liquids were analyzed as sold. Results are reported as prepared for feeding to allow for comparisons among samples, where ppb=parts per billion. Conversions were based on label preparation instructions. It is assumed that there is no arsenic contribution from water used to make the prepared for feeding product.

[b] Arsenic refers to total arsenic. Arsenic analyses were conducted using inductively coupled plasma mass spectrometry (ICP-MS) (<https://www.fda.gov/media/87509/download>). Limits of Quantitation (LOQs) expressed as prepared for feeding ranged from 0.2 to 0.4 ppb; Limits of Detection (LODs) expressed as prepared for feeding ranged from 0.05 to 0.2 ppb. Results below the LOD are reported as <LOD. Trace values (those greater than the LOD and less than the LOQ) are reported in italics.

Infant formula samples were collected as part of a special survey that consisted of a total of 344 infant formulas and toddler drinks. Data from the toddler drinks will be made available following completion of ongoing testing conducted under the Closer to Zero initiative.

Analytical Results for Lead in Infant Formula (FY2023-2025)

The data in this table represent 312 samples of infant formulas tested in FY2023-2025 as part of a special survey.

[a] Powders, Ready-to-Feed Liquids, and Concentrated Liquids were analyzed as sold. Results are reported as prepared for feeding to allow for comparisons among samples, where ppb=parts per billion. Conversions were based on label preparation instructions. It is assumed that there is no lead contribution from water used to make the prepared for feeding product.

[b] Lead analyses were conducted using inductively coupled plasma mass spectrometry (ICP-MS) (<https://www.fda.gov/media/87509/download>). Limits of Quantitation (LOQs) expressed as prepared for feeding ranged from 0.1 to 0.4 ppb; Limits of Detection (LODs) expressed as prepared for feeding ranged from 0.04 to 0.1 ppb. Results below the LOD are reported as <LOD. Trace values (those greater than the LOD and less than the LOQ) are reported in italics.

Infant formula samples were collected as part of a special survey that consisted of a total of 344 infant formulas and toddler drinks. Data from the toddler drinks will be made available following completion of ongoing testing conducted under the Closer to Zero initiative.

[a] Powders, Ready-to-Feed Liquids, and Concentrated Liquids were analyzed as sold. Results are reported as prepared for feeding to allow for comparisons among samples, where ppb=parts per billion. Conversions were based on label preparation instructions. It is assumed that there is no cadmium contribution from water used to make the prepared for feeding product.

[b] Cadmium analyses were conducted using inductively coupled plasma mass spectrometry (ICP-MS) (<https://www.fda.gov/media/87509/download>). Limits of Quantitation (LOQs) expressed as prepared for feeding ranged from 0.1 to 0.3 ppb; Limits of Detection (LODs) expressed as prepared for feeding ranged from 0.04 to 0.1 ppb. Results below the LOD are reported as <LOD. Trace values (those greater than the LOD and less than the LOQ) are reported in italics.

Infant formula samples were collected as part of a special survey that consisted of a total of 344 infant formulas and toddler drinks. Data from the toddler drinks will be made available following completion of ongoing testing conducted under the Closer to Zero initiative.

Analytical Results for Mercury in Infant Formula (FY2023-2025)

The data in this table represent 312 samples of infant formulas tested in FY2023-2025 as part of a special survey.

[a] Powders, Ready-to-Feed Liquids, and Concentrated Liquids were analyzed as sold. Results are reported as prepared for feeding to allow for comparisons among samples, where ppb=parts per billion. Conversions were based on label preparation instructions. It is assumed that there is no mercury contribution from water used to make the prepared for feeding product.

[b] Mercury analyses were conducted using inductively coupled plasma mass spectrometry (ICP-MS) (<https://www.fda.gov/media/87509/download>). Limits of Quantitation (LOQs) expressed as prepared for feeding ranged from 0.08 to 0.2 ppb; Limits of Detection (LODs) expressed as prepared for feeding ranged from 0.03 to 0.08 ppb. Results below the LOD are reported as <LOD. Trace values (those greater than the LOD and less than the LOQ) are reported in italics.

Infant formula samples were collected as part of a special survey that consisted of a total of 344 infant formulas and toddler drinks. Data from the toddler drinks will be made available following completion of ongoing testing conducted under the Closer to Zero initiative.
