Intended Use

The COBAS AMPLICOR CT/NG Test for Chlamydia trachomatis is a qualitative in vitro test for the detection of C. trachomatis plasmid DNA in urine from males and females, in endocervical swab specimens, and in male urethral swab specimens as evidence of symptomatic or asymptomatic infection with C. trachomatis. C. trachomatis DNA is detected by Polymerase Chain Reaction (PCR) amplification of target DNA and by hybridization capture of amplified target using the COBAS AMPLICOR Analyzer.

Summary and Explanation of the Test

Chlamydia are gram-negative, non-motile bacteria that exist as obligate intracellular parasites of eukaryotic cells due to their inability to synthesize ATP. The genus Chlamydia consists of three reported species: C. trachomatis, C. psittaci, and C. pneumoniae (TWAR). C. psittaci is primarily an animal pathogen.

C. trachomatis infections are now recognized as the leading cause of sexually transmitted diseases (STD) in the United States, where more than 4,000,000 cases occur per year. In Europe, approximately 3,000,000 cases occur annually. C. trachomatis is known to cause cervicitis, pelvic inflammatory disease (PID), infant conjunctivitis, infant pneumonia, urethritis, epididymitis and proctitis. C. trachomatis is also the most frequent cause of non-gonococcal urethritis (NGU) in men (approximately 25-55% of cases). Among women, the consequences of chlamydial infections are severe if left untreated. Since approximately half of these infections are asymptomatic, many cases go undetected and untreated, leading to additional problems particularly with pregnant women. Babies born to chlamydia-infected mothers are at high risk of developing inclusion conjunctivitis and pneumonia.

Several methods are available for the detection of C. trachomatis in clinical specimens. These methods include direct Giemsa staining of infected tissue, detection of chlamydial inclusion bodies in infected culture cells using fluorescent antibody stain, direct antigen detection using fluorescent antibody stain and nucleic acid probes. Culture is highly specific but is less than 100% sensitive when applied in routine clinical practice. Because chlamydial culture is not 100% sensitive, it has been suggested that multiple non-culture tests be used to identify infected specimens that are missed by culture. Non-culture testing methods are used to identify organism components (protein or nucleic acid) that are presumed to correlate with infectious organisms. These methods may detect additional positive specimens missed by culture. Because these methods are less than 100% specific, verification of C. trachomatis antigen or nucleic acid by an alternate method has been recommended (1993 CDC recommended action).

Principles of the Procedure

The COBAS AMPLICOR CT/NG Test for Chlamydia trachomatis is based on four major processes: specimen preparation; PCR amplification of target DNA using CT specific complementary primers; hybridization of the amplified DNA to oligonucleotide probes specific to the target(s); and detection of the probe-bound amplified DNA by colorimetric determination.

The development of a PCR assay involves identifying the particular region of the target DNA to be amplified and synthesizing two short biotinylated oligonucleotide probes specific to the target(s) and detection of the probe-bound amplified DNA by colorimetric determination.
Chlamydia trachomatis

Specimen Preparation

Urogenital epithelial cells collected on swabs or pelleted from urine are treated with a detergent solution to release the chlamydial DNA contained in the chlamydial reticulate bodies. A second detergent solution is then added to prepare the lysed specimen for amplification.

PCR Amplification

Target Selection

In addition to chromosomal DNA, C. trachomatis contains an approximately 7,500 base pair cryptic plasmid that is common to all serovars of C. trachomatis. The COBAS AMPLICOR CT/NG Test for Chlamydia trachomatis uses the biotinylated primers CP24 and CP27 to define a sequence of approximately 207 nucleotides within the cryptic plasmid DNA of C. trachomatis.

Target Amplification

Processed specimens are added to the amplification mixture in amplification tubes (A-tubes) in which PCR amplification occurs. The reaction mixture is heated to denature the double-stranded DNA helix and expose the specific primer target sequences on the C. trachomatis cryptic plasmid. As the mixture cools, the biotinylated primers CP24 and CP27 anneal to the target DNA. The thermostable Thermus aquaticus DNA polymerase (Taq pol), in the presence of excess deoxynucleoside triphosphates (dNTPs), including deoxyadenosine, deoxyguanosine, deoxycytidine, deoxyuridine (in place of thymidine) triphosphates, extends the annealed primers along the target templates to produce a 207-base pair double-stranded DNA molecule termed an amplicon. The COBAS AMPLICOR Analyzer automatically repeats this process for 35 cycles, each cycle theoretically doubling the amount of amplicon DNA.

Internal Control Amplification

In enzyme-based amplification processes such as PCR, efficiency can be reduced by inhibitors that may be present in the clinical specimen. The CT/NG Internal Control permits the optional identification of processed specimens containing substances that may interfere with PCR amplification. The CT/NG Internal Control is a non-infectious, recombinant plasmid DNA with primer binding regions identical to those of the C. trachomatis target sequence, a randomized internal sequence of similar length and base composition as the C. trachomatis target sequence, and a unique probe binding region that differentiates the CT/NG Internal Control from target amplicon. These features were selected to ensure equivalent amplification of both the CT/NG Internal Control and the C. trachomatis target DNA. The CT/NG Internal Control Reagent is included in the
COBAS AMPLICOR CT/NG Amplification Kit and is introduced into each amplification reaction to be co-amplified with target DNA from the clinical specimen. The optional COBAS AMPLICOR Internal Control Detection Kit contains an IC-specific oligonucleotide capture probe that can be used to identify a positive IC signal in the reaction mixture. The CT/NG Internal Control is designed to ensure that specimens do not contain inhibitors that would interfere with the amplification and detection of 20 or more copies of *C. trachomatis* target nucleic acid as determined by Poisson analysis.

**Selective Amplification**

Selective amplification of target nucleic acid from the clinical specimen is achieved in the COBAS AMPLICOR CT/NG Test for *Chlamydia trachomatis* by the use of AmpErase® (uracil-N-glycosylase) and deoxyuridine triphosphate (dUTP). AmpErase recognizes and catalyzes the destruction of DNA containing deoxyuridine but not DNA strands containing thymidine. Deoxyuridine is not present in naturally occurring DNA, but is always present in amplicon due to the use of deoxyuridine triphosphate in place of thymidine triphosphate as one of the dNTPs in the Master Mix reagent; therefore, only amplicon contain deoxyuridine. Deoxyuridine renders contaminating amplicon susceptible to destruction by AmpErase prior to amplification of the target DNA. AmpErase, which is included in the Master Mix reagent, catalyzes the cleavage of deoxyuridine-containing DNA at the deoxyuridine residues by opening the deoxyribose chain at the C1-position. When heated in the first thermal cycling step at the alkaline pH of the Master Mix, the amplicon DNA chain breaks at the position of the deoxyuridine, thereby rendering the DNA non-amplifiable. AmpErase is inactive at temperatures above 55°C, i.e., throughout the thermal cycling steps, and therefore does not destroy target amplicon. Following amplification, any residual enzyme is denatured by the addition of the Denaturation Solution, thereby preventing the degradation of any target amplicon. AmpErase in the COBAS AMPLICOR CT/NG Test for *Chlamydia trachomatis* has been demonstrated to inactivate at least 10³ copies of deoxyuridine-containing *C. trachomatis* amplicon per PCR.

**Hybridization Reaction**

Following PCR amplification, the COBAS AMPLICOR Analyzer automatically adds Denaturation Solution to the A-tubes to chemically denature the CT amplicon and the CT/NG Internal Control amplicon to form single-stranded DNA. Aliquots of denatured amplicon are then transferred to detection cups (D-cups). A suspension of magnetic particles coated with an oligonucleotide probe specific for *C. trachomatis* (or Internal Control, at the user's option) is added to the individual D-cups. The biotin-labeled CT and CT/NG Internal Control amplicon are hybridized to the target-specific oligonucleotide probes bound to the magnetic particles. The hybridization of amplicon to the target-specific probe increases the overall specificity of the test.

**Detection Reaction**

Following the hybridization reaction, the COBAS AMPLICOR Analyzer washes the magnetic particles in the D-cups to remove unbound material and then adds Avidin-Horseradish Peroxidase Conjugate. The Avidin-Horseradish Peroxidase Conjugate binds to the biotin-labeled amplicon hybridized to the target-specific oligonucleotide probes bound to the magnetic particles. The COBAS AMPLICOR Analyzer removes unbound conjugate by washing the magnetic particles and then adds a substrate solution containing hydrogen peroxide and 3,3',5,5'-tetramethylbenzidine (TMB) to each D-cup. In the presence of hydrogen peroxide, the particle-bound horseradish peroxidase catalyzes the oxidation of TMB to form a colored complex, the absorbance of which is measured by the COBAS AMPLICOR Analyzer at a wavelength of 660 nm.
Reagents

**AMPLICOR CT/NG Specimen Preparation Kit**

**CT/NG PREP**
- 100 Tests
- P/N: 20759414
- ART: 07 5941 4
- US: 83315

**CT/NG URINE WASH**
- (CT/NG Urine Wash Buffer)
- Tris-HCl buffer
- 300 mM Sodium chloride
- < 0.1% Detergent
- 0.09% Sodium azide

**CT/NG LYS**
- (CT/NG Lysis Reagent)
- Tris-HCl buffer
- < 1% Solubilizer
- 0.09% Sodium azide

**CT/NG DIL**
- (CT/NG Specimen Diluent)
- Tris-HCl buffer
- 6 mM Magnesium chloride
- < 25% Detergent
- 0.05% Sodium azide

**AMPLICOR CT/NG Amplification Kit**

**CT/NG AMP**
- 96 Tests
- P/N: 20759902
- ART: 07 5990 2
- US: 83319

**CT/NG MMX**
- (CT/NG Master Mix)
- Tris-HCl buffer
- EDTA
- 100 mM KCl
- Glycerol
- < 0.016% dUTP
- < 0.01% AmpliTaq® (Taq DNA Polymerase, microbial)
- < 0.005% dATP, dCTP, and dGTP
- < 0.01% AmpErase uracil-N-glycosylase (microbial)
- < 0.0004% CP24 and CP27 primers, biotinylated
- 0.05% Sodium azide

**CT/NG IC**
- (CT/NG Internal Control)
- Tris-HCl buffer
- 8 copies/µL of non-infectious plasmid DNA (microbial)
- containing CT primer binding sequences and a unique probe
- binding region equivalent to approximately 21 IC copies/test
- < 0.005% Poly rA RNA (synthetic)
- EDTA
- Amaranth dye
- 0.05% Sodium azide

11/2002, Revision 2.0 COBAS AMPLICOR CT/NG Test for Chlamydia trachomatis
CT (+) C  
[C. trachomatis (+) Control]
- Tris-HCl buffer
- 8.6 copies/µL of non-infectious plasmid DNA (synthetic) containing C. trachomatis sequences equivalent to approximately 20 copies/test
- < 0.005% Poly rA RNA (synthetic)
- < 0.5% Detergent
- EDTA
- 0.05% Sodium azide

NG (+) C  
[C. trachomatis (-) Control]
- Tris-HCl buffer
- 8.6 copies/µL of non-infectious plasmid DNA (synthetic) containing N. gonorrhoeae sequences equivalent to approximately 20 copies/test
- < 0.005% Poly rA RNA (synthetic)
- < 0.5% Detergent
- EDTA
- 0.05% Sodium azide

Warnings and Precautions

For in vitro diagnostic use.

The use of the term copy in this method manual refers to 1 copy of C. trachomatis target nucleic acid. One (1) copy is equivalent to the smallest amount of C. trachomatis target nucleic acid that would generate a positive PCR test result.

This test is for use only with endocervical, urethral, and urine specimens. This test is not intended for use with throat, rectal, or other types of specimens.
Do not pipet by mouth.

Do not eat, drink or smoke in laboratory work areas. Wear protective disposable gloves, laboratory coats and eye protection when handling specimens and kit reagents. Wash hands thoroughly after handling specimens and kit reagents.

Avoid microbial contamination of reagents when removing aliquots from reagent bottles. The use of sterile disposable pipets and pipet tips is recommended.

Do not pool reagents from different lots or from different bottles of the same lot.

Dispose of unused reagents and waste in accordance with country, federal, state, and local regulations.

Do not use a kit after its expiration date.

Material Safety Data Sheets (MSDS) are available on request from your local Roche office.

Workflow in the laboratory must proceed in a uni-directional manner, beginning in the Pre-Amplification Area and moving to the Post-Amplification (Amplification/Detection) Area. Pre-amplification activities must begin with reagent preparation and proceed to specimen preparation. Supplies and equipment must be dedicated to each pre-amplification activity and not used for other activities or moved between areas. Gloves must be worn in each area and must be changed before leaving that area. Equipment and supplies used for reagent preparation must not be used for specimen preparation activities or for pipetting or processing amplified DNA or other sources of target DNA. Post-amplification supplies and equipment must remain in the Post-Amplification Area at all times.

Specimens should be handled as if infectious using safe laboratory procedures such as those outlined in *Biosafety in Microbiological and Biomedical Laboratories* and in the NCCLS Document M29-A. Thoroughly clean and disinfect all work surfaces with a freshly prepared solution of 0.5% sodium hypochlorite in deionized water.

**Note**  
*Commercial liquid household bleach typically contains sodium hypochlorite at a concentration of 5.25%. A 1:10 dilution of household bleach will produce a 0.5% sodium hypochlorite solution.*

For specimens transported in *Chlamydia culture transport media*, swabs should be left in the culture transport tube to provide visual evidence of specimen inoculation. The COBAS AMPLICOR CT/NG Test for *Chlamydia trachomatis* was evaluated using specimens transported with the swab in the Chlamydia culture transport medium (CTM) tube. CTM specimens transported without swabs have not been evaluated and are not recommended for use with this test.

Storage of urine specimens at room temperature for more than 24 hours may result in specimen degradation. Urine specimens stored for longer than 24 hours at room temperature should not be used for testing.

**CT/NG URINE WASH, CT/NG LYS, CT/NG DIL, CT/NG MMX, CT/NG IC, CT (+) C, NG (+) C, CT PS1 and IC PS1** contain sodium azide. Sodium azide may react with lead and copper plumbing to form highly explosive metal...
While disposing of sodium azide containing solutions down laboratory sinks, flush the drains with a large volume of water to prevent azide buildup.

Wear eye protection, laboratory coats and disposable gloves when handling DN4, CN4, SB3, SB, and Working Substrate (mixed SB3 and SB reagent). Avoid contact of these materials with the skin, eyes or mucous membranes. If contact does occur, immediately wash with large amounts of water. Burns can occur if left untreated. If spills of these reagents occur, dilute with water before wiping dry.

Avoid contact between the skin or mucous membranes and SB or the Working Substrate. If skin contact occurs, wash immediately with large amounts of water.

SB and Working Substrate contain dimethylformamide which has been reported to be toxic in high oral doses and may be harmful to the unborn child. Skin contact, inhalation of fumes and ingestion must be avoided. If skin contact occurs, wash thoroughly with soap and water and seek medical advice immediately.

Screw-cap tubes must be used for specimen and control preparation to prevent splashing and potential cross-contamination of specimens. Do not use snap cap tubes.

### Storage and Handling Requirements

*Do not freeze reagents.*

Store CT/NG LYS at 2-25°C. Store CT/NG URINE WASH and CT/NG DIL at 2-8°C. If a precipitate forms in any of these reagents during storage, warm to ambient temperature and mix thoroughly prior to use. These reagents are stable until the expiration date indicated.

Store CT/NG MMX and CT/NG IC at 2-8°C. These reagents are stable until the expiration date indicated. Working Master Mix (prepared by the addition of CT/NG IC to CT/NG MMX) must be stored at 2-8°C and is stable for 4 weeks.

Store CT (+) C and NG (+) C at 2-8°C. These reagents are stable until the expiration date indicated.

Store CT PS1 and CT4 at 2-8°C. These reagents are stable until the expiration date indicated. Once CT PS1 and CT4 are mixed, the Working Reagent is stable for 30 days at 2-8°C. This Working Reagent can be used for a maximum of 6 instrument cycles (12 hours per cycle) and must be stored at 2-8°C between instrument cycles.

Store IC PS1 and IC4 at 2-8°C. These reagents are stable until the expiration date indicated. Once IC PS1 and IC4 are mixed, the Working Reagent is stable for 21 days at 2-8°C. This Working Reagent can be used for a maximum of 6 instrument cycles (12 hours per cycle) and must be stored at 2-8°C between instrument cycles.

Store DN4 at 2-25°C. DN4 is stable until the expiration date indicated. Once opened, DN4 is stable for 30 days at 2-8°C or until the expiration date, whichever comes first. DN4 can be used for a maximum of 6 instrument cycles (12 hours per cycle) and must be stored at 2-8°C between instrument cycles.
Store CN4 at 2-8°C. CN4 is stable until the expiration date indicated. Once opened, CN4 reagent is stable for 30 days at 2-8°C or until the expiration date, whichever comes first. CN4 can be used for a maximum of 6 instrument cycles (12 hours per cycle) and must be stored at 2-8°C between instrument cycles.

Store SB3 and SB at 2-8°C. Unopened, these reagents are stable until the expiration dates indicated. Working Substrate must be prepared each day by mixing SB3 with SB. The Working Substrate is stable on the COBAS AMPLICOR Analyzer for 16 hours. Do not expose SB3, SB, or Working Substrate to metals, oxidizing agents or direct light.

Store WB at 2-25°C. WB is stable until the expiration date indicated. Working Wash Buffer (1X), prepared by diluting WB 1:10 with distilled or deionized water, must be stored at 2-25°C in the COBAS AMPLICOR Wash Buffer Reservoir and is stable for 2 weeks from the date of preparation. Do not top off the COBAS AMPLICOR Wash Buffer Reservoir.

Store partially used detection reagents at 2-8°C between instrument runs. Check expiration date of opened or Working Reagents prior to loading on the COBAS AMPLICOR Analyzer.

Materials Required but Not Provided

Specimen Collection

- Endocervical and urethral specimen collection swabs - use only dacron, rayon, or calcium alginate tipped collection swabs with plastic or non-aluminum wire shafts
- Chlamydia Culture Transport Media (CTM) - use only 2SP CTM, Bartels ChlamTrans™ CTM (Bartels, Inc.), SPG CTM, or M4 CTM (MicroTest, Inc.)
- Polypropylene, preservative-free urine collection cups

Pre-Amplification – Reagent Preparation Area

- COBAS AMPLICOR A-ring fitted with 12 A-tubes (ART: 10 4563 6)
- COBAS AMPLICOR A-ring holder
- Plastic resealable bag
- Eppendorf® Repeater® pipet with 1.25 mL Eppendorf Combitip® Reservoir (sterile, individually wrapped)
- Pipettors (capacity 100 µL)* with aerosol barrier or positive displacement tips
- Vortex mixer
- Disposable gloves, powderless

Pre-Amplification – Specimen and Control Preparation Area

- 2.0 mL polypropylene screw-cap tubes, sterile, non-siliconized, conical (Sarstedt 72.693.105 or equivalent)**
- Tube racks (Sarstedt 93.1428 or equivalent)
- Pipettors (capacity 50 µL, 100 µL, 200 µL, 250 µL, 500 µL and 1000 µL)* with aerosol barrier or positive displacement tips
- Microcentrifuge (max. RCF 16,000 x g, min. RCF 12,500 x g); Eppendorf 5415C, HERMLE Z230M, or equivalent
Extended aerosol barrier tips (Matrix 7055 or equivalent) for use with specimens transported in M4 Culture Transport Medium or Bartels ChlamTrans Chlamydial Transport Medium
- 37°C ± 2°C heating block
- Vortex mixer
- Absorbent paper
- Disposable gloves, powderless

Post-Amplification – Amplification/Detection Area

- COBAS AMPLICOR Analyzer and printer
- Operator’s Manual for the COBAS AMPLICOR Analyzer
- COBAS AMPLICOR CT/NG Test for Chlamydia trachomatis Method Manual
- Racks of D-cups (ART: 10 4564 4)
- Distilled or deionized water
- 5 mL serological pipets
- Graduated cylinder (minimum 1 Liter)
- Vortex mixer
- Disposable gloves, powderless

* Pipettors should be accurate within 3% of stated volume. Aerosol barrier or positive displacement tips must be used where specified to prevent specimen and amplicon cross-contamination.

** Screw-cap tubes must be used for specimen and control preparation to prevent splashing and potential cross-contamination of specimens. Do not use snap cap tubes.

Specimen Collection, Transport and Storage

Note

Handle all specimens as if they are capable of transmitting infectious agents.

The only acceptable specimens are:

1. Urine specimens (male and female) transported in clean polypropylene containers. Do not use urine specimens collected in containers containing preservatives.

2. Endocervical and urethral swab specimens collected and transported in 2SP Culture Transport Medium, Bartels ChlamTrans Chlamydial Transport Medium (Bartels, Inc.), SPG CTM, or M4 Culture Transport Medium (MicroTest, Inc.). Media lots must be qualified for use in each laboratory (see “Quality Control” section for details).

For reliable test results, follow instructions below for proper specimen collection. This test is not intended for use with throat, rectal, or types of specimens other than those indicated.

In order to ensure the delivery of high quality specimens to the laboratory for testing, urine and urogenital swab specimens should be transported to the laboratory in as short a time as practical. Do not allow specimens to be transported without controlled temperature conditions.
Specimen Collection

Urine Specimens (Male and Female)

Note

Patient must not have urinated during the previous 2 hours.

1. Collect 10 to 50 mL of first catch urine (the first part of the stream) into a clean polypropylene container without preservatives.

2. Seal the specimen container and label appropriately. Follow the laboratory’s collection and transport procedure. The specimen may be transported to the test site at room temperature 18-25°C.

Swab Specimens (Male and Female) Collected in Culture Transport Media

1. Endocervical and urethral swab specimens can be collected and transported in 1 to 3 mL 2SP Culture Transport Medium, Bartels ChlamTrans Chlamydial Transport Medium (Bartels, Inc.), SPG Culture Transport Medium, or M4 Culture Transport Medium (MicroTest, Inc.). Use recommended methods to sample columnar and squamo-columnar cells after removing cervical mucus1.

2. Use only dacron, rayon, or calcium alginate tipped collection swabs with plastic or non-aluminum wire shafts. Do not use collection swabs with wooden or aluminum shafts.

3. Leave swabs in the transport media. Seal the specimen container and label appropriately. Follow the laboratory’s collection and transport procedure. Refrigerate swab specimens if transport to the laboratory is delayed for more than one hour from the time of collection.

Specimen Transport

Urine Specimens (Male and Female)

1. Urine specimens may be transported to the test site at 18 - 25°C. Urine specimens are stable for 24 hours at 18 - 25°C.

2. Urine specimens that require shipment to off-site test centers must be shipped via overnight delivery with guaranteed arrival within 24 hours; shipment can be at 18 - 25°C. If urine specimens are shipped at 18 - 25°C, they should be stored at 2-8°C until time of shipment to ensure that the period of 18 - 25°C storage does not exceed 24 hours. Specimens must be shipped in compliance with all applicable local, state and country regulations for the transport of etiologic agents18.

Swab Specimens (Male and Female) Collected in Culture Transport Media

1. Swab specimens may be transported to the test site at 18 - 25°C provided that the total time of storage and transport at 18 - 25°C is less than 1 hour. Refrigerate swab specimens if transport to the laboratory is delayed for more than one hour from the time of collection. If used for culture, specimens should be handled using recommendations for culture (-60°C if not cultured within 24 hr).

2. Swab specimens that require shipment to off-site laboratories should be shipped at refrigerated temperature as soon as possible after collection according to the laboratory’s procedures for the transport of chlamydial culture specimens. Specimens must be shipped in compliance with all applicable local, state and country regulations for the transport of etiologic agents18.
Specimen Storage

Note

Routine freezing or prolonged storage of specimens may affect performance.

Urine Specimens (Male and Female)

Urine specimens that will not be processed within 24 hours of collection must be stored at 2-8°C and must be processed within 7 days of collection. Urine specimens that can not be processed within 7 days of collection can be stored at -20°C or lower for up to 2 months.

Swab Specimens (Male and Female) Collected in Culture Transport Media

Store swab specimens that are not tested upon receipt at the testing laboratory at 2-8°C and process within 7 days. Swab specimens that cannot be processed within 7 days of collection must be stored at -20°C or colder and tested within 30 days of collection.

Instructions For Use

Note

For detailed operating instructions, refer to the Operator's Manual for the COBAS AMPLICOR Analyzer.

Note

All reagents must be at ambient temperature before use. Use pipettors with aerosol barrier or positive displacement tips where specified. Use extreme care to ensure selective amplification.

Note

Urine and swab specimens must be at ambient temperature before use. Use pipettors with aerosol barrier or positive displacement tips where specified. Use extreme care to ensure selective amplification.

Note

Screw-cap tubes must be used for specimen and control preparation to prevent splashing and potential cross-contamination of specimens. Do not use snap cap tubes.

Run Size

Each kit contains reagents sufficient for eight 12-specimen runs, which may be performed separately or simultaneously. At least one replicate of the C. trachomatis (+) Control and one replicate of the C. trachomatis (-) Control must be included in each test run (see "Quality Control" section).

The Specimen Preparation Reagents are packaged in single 100-test bottles. The C. trachomatis (+) Controls and C. trachomatis (-) Controls are supplied in single bottles containing enough material to prepare 8 sets of processed controls. The CT/NG Master Mix and the CT/NG Internal Control are provided in three bottles each containing enough material to perform 32 specimen runs. For the most efficient use of reagents, specimens and controls should be processed in batches that are multiples of 12.

Workflow

The COBAS AMPLICOR CT/NG Test for Chlamydia trachomatis can be completed in one day or over two days. If the testing is to be completed in a single workday, follow the instructions in Reagent Preparation, Specimen Preparation, Control Preparation, Amplification and Detection in order. Testing can be completed over 2 days by performing Specimen Preparation and Control Preparation on Day 1, followed by Reagent Preparation, Amplification and Detection on Day 2.
**Reagent Preparation**  
Performed in: Pre-Amplification – Reagent Preparation Area

1. Determine the appropriate number of A-rings needed for patient specimen and control testing. Place the A-ring(s) in the A-ring holder(s).

**Note**  
Even if CT/NG Internal Control detection will not be performed, CT/NG IC must be added to the Master Mix.

2. Prepare Working Master Mix by adding 100 µL of CT/NG IC to one vial of CT/NG MMX. Mix well by inverting 10-15 times. Working Master Mix must be stored at 2-8°C and used within 4 weeks of preparation.

3. Add 50 µL of Working Master Mix into each A-tube using a repeat pipettor or a pipettor with an aerosol barrier tip or a positive displacement tip. Do not close the covers of the A-tube(s) at this time.

4. Place the A-ring(s) containing Working Master Mix in a resealable plastic bag and seal the plastic bag securely. Move the A-ring(s) to the Pre-Amplification Specimen Preparation Area. Store the A-ring(s) containing Working Master Mix at 2-8°C in the Pre-Amplification–Specimen Preparation Area until specimen and control preparation is complete. Working Master Mix is stable for 48 hours at 2-8°C in A-tubes sealed in the plastic bag.

**Specimen Preparation**  
Performed in: Pre-Amplification – Specimen Preparation Area

**Urine Specimens (Male and Female)**

1. Label one 2.0 mL screw-cap tube for each patient specimen.

2. Add 500 µL of CT/NG URINE WASH to each of the labeled tubes.

3. Vortex urine thoroughly (3-10 seconds). If using frozen specimens, thaw the specimens at room temperature before vortexing. **(volumes greater than 2 mL must be thawed overnight at 2-8°C); continue processing even if a precipitate is present. Carefully remove caps from urine specimen containers. Take care to avoid contaminating gloves with urine in the cap. If contamination should occur, replace gloves with a clean pair before proceeding to the next specimen.**

4. Add 500 µL of each well-mixed patient urine to the appropriately labeled tube containing CT/NG URINE WASH. Use a new aerosol barrier tip for each specimen. Recap the tubes and mix well by vortexing.

5. Incubate at 37°C for 15 minutes.

6. Centrifuge at ≥ 12,500 x g for 5 minutes.

7. Pour off supernatant and blot each tube on a separate sheet of absorbent paper.

8. Using a new aerosol barrier pipet tip for each specimen, add 250 µL of CT/NG LYS to each tube. Recap tubes and mix well by vortexing.

9. Incubate tubes for 15 minutes at room temperature.
10. Using a new aerosol barrier pipet tip for each specimen, add 250 µL of CT/NG DIL to each tube. Recap tubes and mix well by vortexing.

11. Centrifuge tubes for 10 minutes at ≥ 12,500 x g.

12. Processed specimens may be kept at room temperature for up to 2 hours before transferring aliquots to the A-tubes containing Working Master Mix. Store processed specimens at 2-8°C if aliquots will not be added to the A-tubes within 2 hours. Processed specimens stored at 2-8°C must be tested within 7 days.

13. If processed specimens were stored at 2-8°C, they must be warmed to room temperature and mixed well by vortexing prior to amplification. After vortexing, centrifuge processed specimens for 10 minutes at ≥ 12,500 x g.

14. Using a pipettor with an aerosol barrier tip, transfer 50 µL of the supernatant to the appropriate A-tube. Use a new aerosol barrier tip for each specimen. Be careful not to disturb the pellet (pellet may not be clearly visible). Record the positions of the patient specimens on the A-ring map. Cap the A-tubes.

15. Store the remainder of each processed specimen at 2-8°C in the event retesting is required. Any retesting must be performed within 7 days of specimen processing.

**Swab Specimens (Male and Female)**

**Note**

*The COBAS AMPLICOR CT/NG Test for Chlamydia trachomatis has been evaluated with 2SP Culture Transport Medium, Bartels ChlamTrans Chlamydial Transport Medium (Bartels, Inc.), SPG CTM and M4 Culture Transport Medium (MicroTest, Inc.). The use of alternative transport media must be evaluated by the laboratory.*

1. **Check that the culture transport media tube contains a swab.** Swabs should be left in the culture transport media tube to avoid mishandling. The presence of a swab in the culture transport media tube does not assure adequate specimen collection.

2. Label one 2.0 mL screw-cap tube for each patient specimen.

3. Add 100 µL of CT/NG LYS to the appropriately labeled 2 mL polypropylene tubes. **Do not use snap cap tubes.** Label each tube.

4. Mix specimens by vortexing. If specimens were stored frozen, thaw at room temperature before vortexing. Carefully remove caps from specimen tubes. Take care to avoid contamination of gloves. If contamination should occur, replace gloves with a clean pair before proceeding to the next specimen.

5. Using a pipettor with a new aerosol barrier tip, add 100 µL of well-mixed specimen to the appropriate tube containing CT/NG LYS. Use a new aerosol barrier tip for each specimen. Recap the tube and mix well by vortexing.

6. Incubate at room temperature for 10 minutes.
7. Using a new aerosol barrier pipet tip for each sample, add 200 µL of CT/NG DIL to each tube. Recap the tube and mix well by vortexing.

8. Incubate at room temperature for 10 minutes.

9. Processed specimens may be kept at room temperature for up to 2 hours before transferring aliquots to A-tubes containing Working Master Mix. Store processed specimens at 2-8°C if aliquots will not be added to the A-tubes within 2 hours. Processed specimens stored at 2-8°C must be tested within 7 days.

10. If processed specimens were stored at 2-8°C, they must be warmed to room temperature and mixed well by vortexing prior to amplification.

11. Using a pipettor with an aerosol barrier tip, transfer 50 µL of each processed specimen to the appropriate A-tube. Use a new aerosol barrier tip for each specimen. Record the positions of the patient specimens on the A-ring map. Cap the A-tubes.

12. Store the remainder of each processed specimen at 2-8°C in the event retesting is required. Any retesting must be performed within 7 days of specimen processing.

**Control Preparation**

Perform in: Pre-Amplification - Control Preparation Area

**Note**

*Working Controls must be prepared fresh each day the test is performed. Working Controls can be used to prepare multiple Processed Controls during the day, but must be discarded at the end of the day.*

**Note**

*The CT (+) Control serves as the positive control for the CT Test. The NG (+) Control serves as the negative control for the CT Test. If testing both swab and urine sample types, it is necessary to prepare one set of controls for each sample type.*

**A. Working Controls:**

Prepare the following CT (+) and CT (−) Working Controls.

1. Using a sterile pipet tip, add 1 mL of CT/NG DIL to each of two, 2-mL screw-cap polypropylene tubes. Label one tube "CT (+) Working Control" and label the other tube "CT (−) Working Control".

2. Vortex the CT (+) C and NG (+) C for 5 seconds at maximum speed. Carefully remove the caps from the tubes. Take care to avoid contamination of gloves. If contamination should occur, replace gloves with a clean pair before proceeding.

3. Using a pipettor with a new aerosol barrier tip, add 100 µL of CT (+) C to the tube labeled "CT (+) Working Control".

4. Using a pipettor with a new aerosol barrier tip, add 100 µL of NG (+) C to the tube labeled "CT (−) Working Control".

5. Recap the tubes and mix well by vortexing. Store at room temperature and discard at the end of the workday.
B. Urine specimens:

Prepare the following CT (+) and CT (-) Processed Controls.

1. Using a sterile pipet tip, add 250 µL of CT/NG LYS into each of two 2-mL screw-cap polypropylene tubes. Label one tube "CT (+) Processed Control" and label the other tube "CT (-) Processed Control."

2. Using a pipettor with a new aerosol barrier tip, add 250 µL of the CT (+) Working Control to the tube labeled "CT (+) Processed Control".

3. Using a pipettor with a new aerosol barrier tip, add 250 µL of the CT (-) Working Control to the tube labeled "CT (-) Processed Control".

4. Re-cap the tubes and mix well by vortexing. Incubate for 10 minutes at room temperature. Store at room temperature and discard at the end of the workday.

5. Using a pipettor with an aerosol barrier tip, transfer 50 µL of each Processed Control to the appropriate A-tube. Record the positions of the Controls on the A-ring map. Cap the A-tubes.

6. Move the prepared samples (patient specimens and controls) in the trays to the Post-Amplification Area. These PCR-ready samples may be stored at 2-8°C for up to 16 hours.

C. Swab specimens:

Prepare the following CT (+) and CT (-) Processed Controls.

1. Using a sterile pipet tip, add 100 µL of CT/NG LYS to each of two, 2-mL screw-cap polypropylene tubes. Label one tube "CT (+) Processed Control" and label the other tube "CT (-) Processed Control."

2. Using a sterile pipet tip, add 100 µL of Culture Transport Medium to each of the tubes containing CT/NG LYS.

3. Re-cap the tubes and mix well by vortexing.

4. Using a pipettor with a new aerosol barrier tip, add 200 µL of the CT (+) Working Control to the tube labeled "CT (+) Processed Control".

5. Using a pipettor with a new aerosol barrier tip, add 200 µL of the CT (-) Control to the tube labeled "CT (-) Processed Control".

6. Re-cap the tubes and mix well by vortexing. Incubate for 10 minutes at room temperature. Store at room temperature and discard at the end of workday.

7. Using a pipettor with an aerosol barrier tip, transfer 50 µL of each Processed Control to the appropriate A-tube. Record the positions of the Controls on the A-ring map. Cap the A-tubes.

8. Move the prepared samples (patient specimens and controls) in the trays to the Post-Amplification Area. These PCR-ready samples may be stored at 2-8°C for up to 16 hours.
**Amplification and Detection**

Performed in: Post-Amplification – Amplification/Detection Area

Perform Daily Instrument Maintenance as outlined in the *Operator’s Manual* for the COBAS AMPLICOR Analyzer including:

- Wipe initialization post with a lint-free moist cloth and dry
- Wipe D-cup handler tip with a lint-free moist cloth and dry
- Check Wash Buffer Reservoir and fill if necessary
- Prepare Working Wash Buffer (1X) by adding 1 volume of WB to 9 volumes of distilled or deionized water. Mix well. Keep a minimum of 3-4 liters of Wash Buffer (1X) in the Wash Buffer Reservoir of the system at all times.
- Empty waste container
- Prime the system
- During the priming, check syringes and tubing
- During the priming, check transfer tip

Prior to each run:

- Check waste container and empty if necessary
- Check Wash Buffer Reservoir and add buffer if necessary
- Replace used D-cup racks
- Prime the system

**Instrument Loading and System Operation**

1. Examine the quantities of reagents on board the COBAS AMPLICOR Analyzer. Prepare enough reagent cassettes to complete the workload.

2. Mix CT PS1 well by vortexing. Add 2.5 mL CT PS1 to the CT4 cassette. Place the cassette on the test specific reagent rack. Discard the used CT PS1 vial. Record date of reagent preparation on the CT4 cassette.

3. Mix IC PS1 well by vortexing. Add 2.5 mL IC PS1 to the cassette containing IC4. Place the cassette on the test specific reagent rack. Discard the used IC PS1 vial. Record date of reagent preparation on the IC4 cassette.

4. Prepare the Working Substrate by pipetting 5 mL of SB into one SB3 cassette. Pipet up and down to mix. Discard the empty SB vial. Record the date of preparation on the SB3 cassette.

5. Place the Working Substrate in the generic reagent rack.

6. Place DN4 and CN4 cassettes on the generic reagent rack. Record the date each cassette was opened on each cassette.

7. Identify the reagent racks as generic or test specific using the keypad, barcode scanner, or AMPLILINK™ software as described in the *Operator’s Manual* for the COBAS AMPLICOR Analyzer.
8. Configure the reagent racks by inputting reagent positions and lot numbers into the instrument using the keypad, barcode scanner, or AMPLILINK software as described in the Operator's Manual for the COBAS AMPLICOR Analyzer.

9. Load the reagent racks onto the instrument using the keypad, barcode scanner, or AMPLILINK software as described in the Operator's Manual for the COBAS AMPLICOR Analyzer. Make sure that each reagent cassette is in its assigned position and that each cassette fits tightly into its rack.

10. Place the D-cup rack on the D-cup platform. One D-cup is required for each detection of specimen or control and two D-cups are required for each cassette of Working Substrate to allow for blanking by the COBAS AMPLICOR Analyzer.

11. Place the A-ring(s) into the thermal cycler segment(s) of the COBAS AMPLICOR Analyzer.

12. Load the A-rings into the Analyzer using the keypad, barcode scanner, or AMPLILINK software as described in the Operator's Manual for the COBAS AMPLICOR Analyzer.

14. Tightly close the cover of the thermal cycler segment(s).

15. Start the COBAS AMPLICOR Analyzer as described in the Operator's Manual for the COBAS AMPLICOR Analyzer.

16. Wait for Analyzer to indicate that the load check has passed.

**Note**

The COBAS AMPLICOR Analyzer permits up to 6 separate detections to be performed on the contents of each A-tube. The required quantity of each detection reagent is calculated by the Analyzer, and a load check performed at the start of each run determines if sufficient reagents are available for the requested test.

17. Amplification and detection are automatically performed by the COBAS AMPLICOR Analyzer. Qualitative results are expressed as positive, negative or equivocal based on the absorbance value at 660 nm compared to a Test specific, predefined absorbance cut-off.
Quality Control

At least one replicate of the CT (+) Processed Control, and one replicate of the CT (-) Processed Control must be included in each test run. As with any new laboratory procedure, new operators should consider the use of additional controls each time the test is performed until such time as a high degree of confidence is reached in their ability to perform the test correctly. Each laboratory may determine appropriate target values and limits using recommended methods, e.g., NCCLS C 24-A19. There are no recommendations regarding the order of controls and specimens in the A-ring(s).

Additional controls may be tested according to guidelines or requirements of local, state, and/or federal regulations or accrediting organizations.

Negative Control

The absorbance of the CT (-) Control should be less than 0.20 at 660 nm. If the absorbance of the CT (-) Control is greater than or equal to 0.20, the entire run is invalid. Repeat the entire test process (specimen and control preparation, amplification, and detection). If the absorbance of the processed CT (-) Control is consistently greater than 0.20, contact your local Roche office for technical assistance. The CT (-) Control contains nonhomologous DNA (N. gonorrhoeae sequences) and is intended to monitor contamination of reagents or equipment with target DNA.

Positive Control

The absorbance of the CT (+) Control should be greater than or equal to 2.0 at 660 nm. If the absorbance of the CT (+) Control is less than 2.0, the entire run is invalid. Repeat the entire test process (specimen and control preparation, amplification, and detection). If the absorbance of the CT (+) Control is consistently less than 2.0, contact your local Roche office for technical assistance.

The CT (+) Control contains approximately 20 copies/test of a C. trachomatis plasmid DNA sequence. This is approximately four times the minimum detection level of the assay as determined by Poisson analysis. Amplification and detection of the CT (+) Control assures that amplification occurred. The CT (+) Control will not monitor amplification efficiency or the detection level of the Test.

Validation of Culture Transport Media and Specimen Collection Swabs

All new lots of specimen collection swabs and culture transport media (CTM) that are used to transport swab specimens to the laboratory for testing by the COBAS AMPLICOR CT/NG Test for Chlamydia trachomatis should be qualified for use with the Test to ensure that the swabs and media do not contain PCR interfering substances. Contact your local Roche office to obtain a copy of the Specimen Collection Swab and Transport Media Validation Procedure.

Specimen Processing Control

To test the effectiveness of sample processing, McCoy’s cells infected with C. trachomatis (available from the American Type Culture Collection) should be added to a tube of culture transport medium to a level of 10^3–10^4 cells/mL in the culture transport medium, and incubated for one hour at room temperature. The spiked culture transport medium should be processed and tested using the COBAS AMPLICOR CT/NG Swab Specimen Preparation Procedure described in this Method Manual. Properly processed specimens should give positive COBAS AMPLICOR CT/NG Test for Chlamydia trachomatis results with an absorbance greater than or equal to 2.0 at 660 nm.
Internal Control

The Internal Control is intended to identify specimens that contain polymerase inhibitors. The use of the Internal Control will not eliminate all false negative test results. In clinical studies the proportion of inhibited specimens was highest for urine from females (both symptomatic and asymptomatic) and specimens (both swab and urine) from symptomatic males. Use of the IC is an option for testing specimens routinely, for testing only negative specimens, or for designated patients/specimen types in conformance with laboratory practices.

Results

Interpretation of Results

Without Internal Control Detection

Refer to the Operator’s Manual for the COBAS AMPLICOR Analyzer for printing results and for the interpretation of flags and comments.

1. Check run printout for flags (FLG) and comments to ensure that the run is valid. If run is invalid, repeat the entire run (specimen and control preparation, amplification and detection).

2. For a valid run, specimen results are interpreted as follows:

<table>
<thead>
<tr>
<th>$A_{660}$</th>
<th>COBAS Flag</th>
<th>Interpretation</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt; 0.2</td>
<td>NEGATIVE</td>
<td><strong>C. trachomatis DNA not detected.</strong> Specimen is presumptive negative for <strong>C. trachomatis</strong>. A negative result does not preclude <strong>C. trachomatis</strong> infection because results depend on adequate specimen collection, absence of inhibitors, and sufficient DNA to be detected.</td>
</tr>
<tr>
<td>≥ 2.0</td>
<td>POSITIVE</td>
<td><strong>C. trachomatis DNA detected.</strong> <strong>C. trachomatis</strong> organism viability and/or infectivity cannot be inferred since target DNA may persist in the absence of viable organisms.</td>
</tr>
<tr>
<td>≥ 0.2, &lt; 2.0</td>
<td>GZ 0.2 - 2.0</td>
<td><strong>Equivocal.</strong> Results are inconclusive for <strong>C. trachomatis</strong> DNA. Repeat testing on a new specimen from the patient or additional testing by an alternate test procedure is recommended.</td>
</tr>
</tbody>
</table>

With Internal Control Detection

Refer to the Operator’s Manual for the COBAS AMPLICOR Analyzer for printing results and for the interpretation of flags and comments.

1. Check run printout for flags (FLG) and comments to ensure that the run is valid. If run is invalid, repeat the entire run (specimen and control preparation, amplification and detection).
2. For a valid run, specimen results are interpreted as follows:

<table>
<thead>
<tr>
<th>CT Specimen Result</th>
<th>IC Specimen Result</th>
<th>Interpretation</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>COBAS Flag</td>
<td>A</td>
</tr>
<tr>
<td>&lt; 0.2</td>
<td>NEGATIVE</td>
<td>≥ 0.2</td>
</tr>
</tbody>
</table>

*C. trachomatis DNA not detected.* Specimen is presumptive negative for *C. trachomatis*. A negative result does not preclude *C. trachomatis* infection because results depend on adequate specimen collection, absence of inhibitors, and sufficient DNA to be detected.

| < 0.2              | NEGATIVE           | < 0.2          | NEGATIVE     |

*Inhibitory Specimen. C. trachomatis DNA, if present, would not be detectable.* Process another aliquot of the original specimen and repeat the test. Inhibitors are often labile and specimens initially inhibitory may not be inhibited when repeated. If the original specimen is not available, a new specimen must be collected.

| ≥ 2.0              | POSITIVE           | ANY            | ANY          |

*C. trachomatis DNA detected.* *C. trachomatis* organism viability and/or infectivity cannot be inferred since target DNA may persist in the absence of viable organisms.

| ≥ 0.2, < 2.0      | GZ 0.2 - 2.0      | ANY            | ANY          |

*Equivocal. Results are inconclusive for C. trachomatis DNA.* Repeat testing on a new specimen from the patient or additional testing by an alternate test procedure is recommended.

**Determination of CT and Internal Control Cutoff**

The cutoffs for the CT specimen results and the IC specimen results were determined based on cumulative frequency distributions of absorbance values obtained with patient specimens (male urethral swab, female endocervical swab, male urine and female urine) tested during preclinical studies and were confirmed in the clinical studies performed for the COBAS AMPLICOR CT/NG Test for *Chlamydia trachomatis*. These studies show that the majority of the time, a specimen with CT test results ≥ 2.0 A₆₆₀ will indicate the presence of *C. trachomatis* as shown by culture or Direct Fluorescence Antibody (DFA). A specimen with CT test results < 0.2 A₆₆₀ correlates with negative *C. trachomatis* culture results the majority of the time. Specimens with CT test results ≥ 0.2 A₆₆₀ and < 2.0 A₆₆₀ are inconclusive for the presence of *C. trachomatis* and cannot be interpreted. Similarly, the majority of the time, a specimen with IC test results ≥ 0.2 A₆₆₀ and having a CT test result < 0.2 A₆₆₀ are negative for *C. trachomatis* by culture.

**Procedural Precautions**

Workflow in the laboratory must proceed in a uni-directional manner, beginning in the Pre-Amplification Area and moving to the Post-Amplification (Amplification/Detection) Area. Pre-amplification activities must begin with reagent preparation and proceed to specimen preparation. Supplies and equipment must be dedicated to each Pre-amplification activity and not used for other activities or moved between areas. Gloves must be worn in each area and must be changed before leaving that area. Equipment and supplies used for reagent prepa-
ration must not be used for specimen preparation activities or for pipetting or processing amplified DNA or other sources of target DNA. Post-amplification supplies and equipment must remain in the Post-Amplification Area at all times.

As with any test procedure, good laboratory technique is essential to the proper performance of this assay. Due to the high analytical sensitivity of this test, extreme care should be taken in handling kit reagents or amplification mixtures to avoid contamination. Discard any reagents that may be suspect.

**Procedural Limitations**

Test only the indicated specimen types. The COBAS AMPLICOR CT/NG Test for *Chlamydia trachomatis* has been evaluated using female endocervical swabs, male urethral swabs collected in 2SP, M4 and SPG culture transport media, and female and male urine collected without preservatives. Testing of other specimen types have not been evaluated for use and may result in false negative or false positive results.

Detection of *C. trachomatis* is dependent on the number of organisms present in the specimen and may be affected by specimen collection methods, patient factors (i.e., age, history of STD, presence of symptoms), stage of infection and/or infecting *C. trachomatis* strain.

False negative results may occur due to polymerase inhibition. The CT/NG Internal Control has been added to the COBAS AMPLICOR CT/NG Test for *Chlamydia trachomatis* to permit the identification of processed specimens containing substances that may interfere with PCR amplification of greater than 20 copies/test.

Prevalence of chlamydial infection in a population may affect performance. Positive predictive values decrease when testing populations with low prevalence or individuals with no risk of infection. See Table 2. Because the prevalence of *C. trachomatis* may be low in some populations or patient groups, a false positive rate of 4% to 5% can exceed the true positive rate so that the predictive value of a positive test is very low (see Table 2). Since some patients that are truly infected will not be identified by testing a single specimen for culture or DFA, the true rate of false positives cannot be determined or presumed from the clinical data. The rate of false positive test results may depend on training, operator ability, reagent and specimen handling or other such factors in each laboratory.

Reliable results are dependent on specimen collection, transport, storage and processing procedures. Variables due to storage have not been completely defined. In specimen stability studies, the performance for refrigerated and frozen specimens was similar. However, in clinical studies the sensitivity was lower for male urine specimens that had been frozen and higher for female urine specimens that had been frozen.

The clinical performance of the COBAS AMPLICOR CT/NG Test for *Chlamydia trachomatis* on specimens from pregnant women has not been evaluated.

The addition of AmpErase to the Master Mix enables selective amplification of target DNA; however, good laboratory practices and careful adherence to the procedures specified in this Method Manual are necessary to avoid contamination of reagents.

Therapeutic success or failure cannot be determined using this test.
As with any diagnostic test, results from the COBAS AMPLICOR CT/NG Test for *Chlamydia trachomatis* should be interpreted with consideration of all clinical and laboratory findings.

Use of this product should be limited only to personnel trained in the techniques of PCR.

The COBAS AMPLICOR CT/NG Test for *Chlamydia trachomatis* will not detect plasmid-free variants of *C. trachomatis*.

Specimen adequacy (for swab specimens) can only be assessed by microscopic visualization of columnar epithelial cells in the specimens.

The COBAS AMPLICOR CT/NG Test for *Chlamydia trachomatis* is not recommended for evaluation of suspected sexual abuse and for other medico-legal indications.

Additional testing is recommended in any circumstance when false positive or false negative results could lead to adverse medical, social or psychological consequences.

Specimen storage recommendations are based on studies including 21 culture positive patient specimens (10 swabs and 11 urines) and 52 culture negative patient specimens.

The COBAS AMPLICOR CT/NG Test for *Chlamydia trachomatis* provides qualitative results. No correlation can be drawn between the magnitude of a positive COBAS AMPLICOR CT/NG Test for *Chlamydia trachomatis* absorbance signal and the number of *C. trachomatis* cells within an infected specimen. The test detects only *C. trachomatis*, not *C. psittaci* or *C. pneumoniae*.

The COBAS AMPLICOR CT/NG Test for *Chlamydia trachomatis* for male and female urine testing is recommended to be performed on first catch random urine specimens (defined as the first 10 to 50 mL of the urine stream). The effects of other variables such as first-catch vs. mid-stream, post-douching, etc. have not been evaluated.

The effects of other potential variables such as vaginal discharge, use of tampons, douching, etc. and specimen collection variables have not been evaluated.

The COBAS AMPLICOR CT/NG Test for *Chlamydia trachomatis* is not intended to replace cervical exam and endocervical sampling for diagnosis of urogenital infection. Patients may have cervicitis, urethritis, urinary tract infections, or vaginal infections due to other causes or concurrent infections with other agents.
Interfering Substances

The presence of PCR inhibitors may cause false negative results.

Interfering substances include, but are not limited to the following:

Replens® lubricant has been shown to inhibit PCR and may yield false negative results with this Test.

The presence of mucus in cervical samples may inhibit PCR and cause false negative test results. Mucus free samples are recommended for optimal test performance. Use a sponge or a large swab to remove cervical secretions and discharge before obtaining the sample.

Samples containing greater than 5% (v/v) blood may give false positive results. In clinical studies, 689 of 2306 female swab specimens were noted to be bloody. False positive rates were not higher in these specimens.

EXPECTED VALUES

Prevalence

The rate of positive C. trachomatis test results in patient populations varies depending upon population characteristics such as age, sex, specimen type, risk factors and test methodology. The COBAS AMPLICOR CT/NG Test for Chlamydia trachomatis clinical study was performed at 6 geographically diverse urban sites in the following states: Pennsylvania, Maryland, Louisiana, Indiana, Texas, California. The study included symptomatic and asymptomatic patients from the following populations: patients attending an STD Clinic, female patients at routine OB/GYN visits, female patients at prenatal care visits, patients attending adolescent health clinics, patients at family planning visits. The rate of positive COBAS AMPLICOR CT/NG Test for Chlamydia trachomatis results in the clinical study ranged from 2.4% to 31.3%. The prevalence data from the study are shown by site in Table 1.

Result Distribution

The distribution of COBAS AMPLICOR CT/NG Test for Chlamydia trachomatis absorbance values for all male and female swab specimens, and all male and female urine specimens included in a multi-site clinical study for this product are shown in Figures 1 and 2, respectively. The $A_{660}$ values ranged from 0.000 to 4.000 for each specimen type. The histograms show a distinct separation of positive and negative test results. Figures 3 and 4 show the results for the swab specimen Internal Control and urine specimen Internal Control, respectively. The inhibitory specimens are those with results below 0.2 $A_{660}$.

Performance Characteristics

Analytical Specificity

The analytical specificity of the COBAS AMPLICOR CT/NG Test for *Chlamydia trachomatis* was tested against 132 bacteria, 6 fungal, 1 protozoon and 11 viral strains that may be isolated from the urogenital tract. Each isolate was added to culture transport media and normal human urine using at least 10^4 copies of genomic DNA per test (equivalent to 8x10^5 copies/mL in culture transport media and 4x10^5 copies/mL in urine specimens). The culture transport media and urine specimens were processed and tested using the COBAS AMPLICOR CT/NG Test for *Chlamydia trachomatis*. The following organisms and viruses (some of which had multiple strains tested) gave negative results by the COBAS AMPLICOR CT/NG Test for *Chlamydia trachomatis*:

- Achromobacter xerosis
- Acinetobacter calcoaceticus
- Acinetobacter genosp. 3
- Acinetobacter lwoffi
- Actinomyces israelii
- Aerococcus viridans
- Aeromonas hydrophila
- Agrobacterium radiobacter
- Alcaligenes faealis
- Bacillus subtilis
- Bacillus thuringiensis
- Bacteroides caccae
- Bacteroides fragilis
- Bacteroides gracilis
- Bifidobacterium longum
- Bifidobacterium adolescentis
- Branhamella catarrhalis
- Brevibacterium linens
- Candida albicans
- Candida glabrata
- Candida guilliermondii
- Candida kruazi
- Candida parapsilosis
- Candida tropicalis
- Chlamydia pneumoniae
- Chlamydia psittaci
- Chromobacter violaceus
- Citrobacter freundii
- Clostridium innocuum
- Clostridium perfringens
- Corynebacterium genitalium
- Corynobilacterium xerosis
- Cryptococcus neoformans
- Cytomegalovirus
- Deinococcus radiopugnans
- Derxia gummosa
- Edwardsiella tarda
- Eikenella corrodens
- Enterobacter cloacae
- Enterococcus avium
- Enterococcus faecalis
- Enterococcus faecium
- Lactobacillus parabuchne
- Lactobacillus vaginalis
- Lactococcus lactis cremoris
- Legionella bozemii
- Legionella pneumophila
- Leuconostoc paramesenteroides
- Micrococcus luteus
- Mobiluncus curtisi subsp. curtisi
- Mobiluncus curtisi subsp. homesi
- Moraxella osloensiss
- Morganella morganii
- Mycobacterium smegmatis
- Mycoplasma genitalium
- Mycoplasma hominis
- Mycoplasma pneumoniae
- Neisseria cinerea
- Neisseria elongata
- Neisseria flavescens
- Neisseria gonorrhoeae
- Neisseria kochi
- Neisseria lactamica
- Neisseria meningitidis
- Neisseria mucosa
- Neisseria perflava
- Neisseria polysaccharea
- Neisseria sicca
- Neisseria subflava
- Paracoccus denitrificans
- Pasteurella multocida
- Pediococcus acidilactica
- Peptostreptococcus anaerobius
- Peptostreptococcus magnus
- Peptostreptococcus productus
- Prevotella bivia
- Prevotella corporis
- Prevotella intermedia
- Propionibacterium acnes
- Proteus mirabilis
- Providencia stuartii
- Pseudomonas aeruginosa
- Pseudomonas putida
- Rahnella aquatilis
Analytical Sensitivity

The analytical sensitivity of the COBAS AMPLICOR CT/NG Test for *Chlamydia trachomatis* was determined by testing all 15 *C. trachomatis* serovars (A, B, Ba, C, D, E, F, G, H, I, J, K, L1, L2, and L3). Stock cultures of each serovar were diluted in culture transport media (CTM) and urine to prepare specimens that contained 20, 10, 5 and 1 IFU/test (equivalent to 1600, 800, 400, and 80 IFU/mL for swab specimens and 400, 200, 100, and 20 IFU/mL for urine specimens) after specimen processing. The specimens were amplified and detected according to the standard test protocol. Each processed specimen was amplified and then detected using the standard procedure. Serovars C and J were supplied at low titers that allowed testing only at 1 IFU/test. Serovar Ba was tested only at 1 and 5 IFU/test.

The COBAS AMPLICOR CT/NG Test for *Chlamydia trachomatis* gave positive results for all serovars tested at 20, 10, 5 and 1 IFU/test. The analytical sensitivity (limit of detection) of the COBAS AMPLICOR CT/NG Test for *Chlamydia trachomatis* is 1 IFU/test (equivalent to 20 IFU/mL for urine specimens and 80 IFU/mL for CTM inoculated with a swab specimen).

Precision

A multi-operator study was performed to determine the qualitative precision of the COBAS AMPLICOR CT/NG Test for *Chlamydia trachomatis*. The study was based upon the design suggested in the NCCLS document EP5A20. Three independent operators at three different geographical sites tested a panel of unprocessed urine and swab specimens in duplicate, once a day, for three days. Each run consisted of specimen preparation, amplification and detection of the following specimens in duplicate (number of specimens in parenthesis): culture transport media specimens containing 0 (4), 1.25 (2), 3.75 (2) and 6.25 (2) *C. trachomatis* IFU/test; and urine specimens containing 0 (4), 1 (2), 3 (2) and 5 (2) *C. trachomatis* IFU/test. *Neisseria gonorrhoeae* was added to some culture transport media and urine specimens to determine test performance in the presence of DNA from a non-specific analyte. Tables 3 and 4 summarize the results from this study. All qualitative results for each specimen at each site were correct.
Control Performance

A summary of the performance of the positive and negative kit controls in the COBAS AMPLICOR CT/NG Test for *Chlamydia trachomatis* tested during the clinical study is shown in Table 5. The study was performed over a 9 month period by multiple operators at 6 clinical laboratories. During the course of the study, there were a total of 49 invalid test runs due to out of range control values. There were 38 invalid results due to the CTM controls (9 positive control, 29 negative control) and 11 invalid results due to the Urine controls (5 positive control, 6 negative control).

Clinical Performance

The COBAS AMPLICOR CT/NG Test for *Chlamydia trachomatis* was evaluated in a clinical study conducted at six geographically diverse sites. Swab (endocervical and urethral for females, urethral for males) and urine specimens were obtained from all patients entered into the study. Swab specimens were placed in culture transport media (CTM) used at each site. All swab specimens were tested by standard culture with cyclohexamide treated McCoy cells stained with fluorescein-labeled monoclonal antibody for *C. trachomatis*. Swab specimens that were culture negative but positive by the COBAS AMPLICOR CT/NG Test for *Chlamydia trachomatis* were tested by DFA for the presence of *C. trachomatis*. The COBAS AMPLICOR CT/NG Test for *Chlamydia trachomatis* was performed on all endocervical swab and urine specimens obtained from female patients, and all urethral swabs and urine specimens from male patients. The COBAS AMPLICOR CT/NG Test for *Chlamydia trachomatis* was repeated for all specimens with initial results in the range of 0.2 to 0.8 A$_{660}$ and when IC results were inhibited (negative).

A total of 8523 specimens collected from 4277 patients met the criteria for inclusion in the clinical study (patient was not on antibiotics, a valid culture result was obtained, specimen met storage requirements etc.). Both a swab and urine specimen was entered into the study for 4201 patients; a urine specimen only was entered into the study from 76 patients. Of the 8523 specimens included in the study, 45 specimens gave initial test results in the Equivocal Range and were excluded from the data analyses. Two specimens that were initially inhibitory gave results in the Equivocal Range upon repeat testing. These specimens are excluded from the analyses when the Internal Control was used but included in the analyses when the Internal Control was not used. In addition, 79 specimens were repeatedly inhibitory and were excluded from the data analyses which include the use of the Internal Control because the results were not interpretable. Therefore, 8397 specimens were included in the analyses when the Internal Control result was used and a total of 8478 specimens were included in the analyses when the Internal Control results were not used.

The clinical performance of the test was evaluated by comparing the results of the 8478 swab and urine specimens to the composite results of the comparative tests (culture, sub-culture and DFA). Alternate PCR testing using oligonucleotide primers targeted for a region of the *C. trachomatis* MOMP gene was performed on COBAS AMPLICOR CT/NG Test for *Chlamydia trachomatis* positive, culture/DFA negative specimens. The MOMP test results were not used to calculate the clinical performance characteristics of the test and are reported for information purposes only. Of the 266 COBAS AMPLICOR CT/NG Test for *Chlamydia trachomatis* positive, culture/DFA negative specimens that were classified as false positive results in this study, 185 were positive for *C. trachomatis* when that specimen or the matching urine or swab specimen from that patient was tested by the MOMP assay. These data suggest that many specimens considered as false positive in the Clinical Data Performance Tables did contain *C. trachomatis* DNA.
The results from the clinical study are shown in Tables 6 and 7. Table 6 shows the clinical performance of the COBAS AMPLICOR CT/NG Test for *Chlamydia trachomatis* in comparison to the endocervical culture/DFA results for female patients and to the urethral culture/DFA results for male patients. In this Table, True Positive (TP) represents the number of concordant positive culture or DFA and COBAS AMPLICOR CT/NG Test for *Chlamydia trachomatis* results. True Negative (TN) represents the number of concordant negative culture and COBAS AMPLICOR CT/NG Test for *Chlamydia trachomatis* results. False Negative (FN) represents the number of culture positive, COBAS AMPLICOR CT/NG Test for *Chlamydia trachomatis* negative results. False Positive (FP) represents the number of culture and DFA negative, COBAS AMPLICOR CT/NG Test for *Chlamydia trachomatis* positive results.

Table 7 shows the clinical performance of the COBAS AMPLICOR CT/NG Test for *Chlamydia trachomatis* for testing both swab and urine specimens from female patients combined and separately, for each specimen type, in comparison to the patient infected status. Female patient infected status was determined by endocervical or urethral culture/DFA positive results. The data in Table 7 show that there is better concordance with culture/DFA positive patients when both swab and urine specimens are tested by the COBAS AMPLICOR CT/NG Test for *Chlamydia trachomatis*. The testing of both swab and urine specimens by the COBAS AMPLICOR CT/NG Test for *Chlamydia trachomatis* resulted in fewer unverified positive test results and higher assay sensitivity as compared to single specimen (swab or urine) testing only.

A summary of the test results obtained in the clinical study performed for the COBAS AMPLICOR CT/NG Test for *Chlamydia trachomatis* is contained in Tables 8 and 9. Table 8 summarizes the combinations of test results obtained for female patients; Table 9 summarizes the combinations of test results obtained for male patients. These tables show that patients with a positive result in both a urine and a swab specimen had a lower rate of unverified positivity (false positives relative to culture and DFA) than single positive specimen results. Testing of both specimen types may be useful for increasing the confidence in a positive result using the COBAS AMPLICOR CT/NG Test for *Chlamydia trachomatis*, particularly for low prevalence populations.

The clinical sensitivity and specificity of the COBAS AMPLICOR CT/NG Test for *Chlamydia trachomatis* has not been reliably determined for detecting those patients with clinically active infection that can be transmitted to partners or cause Chlamydia-related sequelae. In the clinical study described here, 24.4% of COBAS AMPLICOR CT/NG Test for *Chlamydia trachomatis* positive results were from patients with negative cultures and DFA tests. The significance of those results that were COBAS AMPLICOR CT/NG Test for *Chlamydia trachomatis* positive, but culture and DFA negative is unknown. A proportion of these COBAS AMPLICOR CT/NG Test for *Chlamydia trachomatis* positive specimens (63.8%) were also positive by an alternate target PCR assay; however, the performance of this alternate target assay has not been established.

</table>

1 Test results without the Internal Control shown in parentheses.

True Positive (TP) represents the number of concordant positive culture or DFA and COBAS AMPLICOR CT/NG Test for Chlamydia trachomatis results.

True Negative (TN) represents the number of concordant negative culture and COBAS AMPLICOR CT/NG Test for Chlamydia trachomatis results.

False Negative (FN) represents the number of culture positive, COBAS AMPLICOR CT/NG Test for Chlamydia trachomatis negative results.

False Positive (FP) represents the number of culture and DFA negative, COBAS AMPLICOR CT/NG Test for Chlamydia trachomatis positive results.
## Table 7

**Performance of COBAS AMPLICOR CT/NG Test for Chlamydia trachomatis vs Patient Status**

**Female Patients Including and Excluding the Internal Control**
