REVIEW OF ONADE-REGULATED PRODUCTS THAT CONTAIN NANOMATERIALS OR OTHERWISE INVOLVE THE USE OF NANOTECHNOLOGY

I. Purpose

This document provides:

- points to consider in identifying new animal drug products containing nanomaterials or involving the application of nanotechnology;
- a means to collect information and establish internal inventories regarding new animal drug products, drug substances, excipients, etc. that are, contain, or make use of nanomaterial(s) or otherwise involve the application of nanotechnology for products regulated by ONADE;
- points to consider for technical sections (TSs) for new animal drug products containing nanomaterial(s) or otherwise involve the application of nanotechnology that might require additional data or special steps to address potential safety or quality issues; and
- general considerations for (generic) investigational new animal drug [(J)INAD] files and (abbreviated) new animal drug applications [(A)NADAs].

II. WHAT MATERIALS ARE CONSIDERED AS NANOMATERIALS

The science of nanotechnology is producing novel nanomaterials to be used in drug formulation and drug delivery. Nanomaterials can have chemical, physical and biological properties that differ from those of their non-nanomaterial counterparts.

In July 2007, the FDA Nanotechnology Task Force issued its initial report to conclude that the current regulatory authority over products subject to premarket review (e.g. drugs) is adequate. The report highlighted the need for FDA to evaluate the adequacy of current testing approaches to assess safety and other relevant characteristics of FDA regulated products that use nanomaterial(s) or otherwise involve the application of nanotechnology.

No regulatory definition for nanomaterial has been adopted by FDA, but in Guidance for Industry (GFI) “Considering Whether an FDA-Regulated Product Involves the Application of Nanotechnology”, the agency has indicated that the following should be asked when considering whether an FDA-regulated product contains nanomaterial(s):

- whether an engineered material or end product has at least one dimension in the nanoscale range (approximately 1 nm to 100 nm); or
• whether an engineered material or end product exhibits properties or phenomena, including physical or chemical properties or biological effects, that are attributable to its dimension(s), even if these dimensions fall outside the nanoscale range, up to one micrometer.

ONADE reviewers should apply these considerations when reviewing submissions. The material may be the active drug substance, excipient, drug delivery platform, or any other component of the formulation.

III. EARLY IDENTIFICATION AND INFORMATION COLLECTION

We review new animal drug products that use nanomaterial(s) or otherwise involve the application of nanotechnology under our existing investigational and application processes. The application of nanotechnology may result in product attributes that differ from those of conventionally manufactured new animal drug products and thus may merit further examination. This document is intended to facilitate early identification of these products. Through early identification, we can request and collect relevant information (e.g., nanomaterial characterization tests, toxicity tests) during the review process. However, FDA does not categorically judge all products containing nanomaterials or otherwise involving application of nanotechnology as intrinsically benign or harmful. New animal drug products containing nanomaterials or otherwise involving the application of nanotechnology are usually identified by either the sponsor/applicant or CVM.

If the sponsor identifies the new animal drug product in their request to open an investigational file as containing nanotechnology or involving application of nanotechnology, the following steps occur.

• The target animal division (TAD) reviewer documents preliminary nanomaterial(s) characterization(s) (e.g., particle size) and a description of the unique role of the particle size/functionality in relation to the final product in the review (see Appendix I), in addition to the information recommended in P&P 1243.4000. If the information is not available in the sponsor’s submission, the TAD reviewer contacts the sponsor to request the information. The information does not need to be sent in as an amendment. The reviewer records the information from the discussion in the review.

• The TAD reviewer uses the Nanotechnology Submission Report Form to report the new animal drug product to CVM’s Nanotechnology Working Group (WG) mailbox. The Nanotechnology WG uses this information to track products, drug substances, excipients, etc. that contain or make use of nanomaterial(s).

• The Nanotechnology WG works with the project manager (PM) and the Document Control Unit (DCU) to ensure that the (J)INAD or the approved (A)NADA will be marked in our Submission Tracking and Reporting System (STARS) as NANOTECH, indicating that the application contains nanomaterial(s) or otherwise involve the use of nanotechnology. This designation appears on the Document Overview Page of STARS (see example below).
Document Classification is a searchable criterion. Reviewers are able to recover all the documents in STARS that are designated as NANOTECH using Document Search (see example below).

Reviewers and PMs proactively identify new animal drug products containing nanomaterial(s) or otherwise involving the use of nanotechnology (e.g., in requests to open investigational files, TSs) based on the considerations presented in Section II and utilizing the list of terms in the appendix of this document. If the reviewer identifies a proposed new animal drug product in an application or submission containing nanomaterial(s) or otherwise involving the use of nanotechnology, they notify their team leader (TL) and the Nanotechnology WG using the Nanotechnology Submission Report Form. The Nanotechnology WG follows the same procedure outlined above to mark the document as NANOTECH in STARS.
IV. POINTS TO CONSIDER FOR ONADE REVIEW

A. In the Investigational Phase (J)INAD

1. Target Animal Safety and Human User Safety reviews

These reviews document:

- if the sponsor has addressed any unique safety concerns related to the use of nanomaterial(s) in the formulation;
- if applicable, a description of how the sponsor has attempted to characterize those hazards;
- any need for additional separate safety studies or the measurement of additional safety parameters in the margin of safety studies, and
- if applicable, human user safety for new animal drug products containing nanomaterials, including the potential routes of exposure (e.g., aerosolization, transdermal).

Examples of situations that may pose unique safety concerns include but are not limited to: changes in drug distribution, genotoxicity, particle trapping, entrance into immunoprivileged sites, and particle aggregation.

2. Effectiveness reviews

Currently, we do not anticipate any specific issues related to nanotechnology that would impact the review process for evaluating effectiveness. The TAD reviewer follows their division’s current procedures for evaluating effectiveness.

3. Review of Formulation Bridging Studies

Because nanotechnology may involve differences in functionality and delivery mechanisms, bridging studies to establish safety or effectiveness (i.e., based upon drug concentrations in serum or plasma) will not be useful unless there is good reason to believe that the concentration of dissolved drug in blood reflects the true drug activity. That is, there should be assurance that the blood concentrations are an accurate reflection of active drug concentrations across the various body tissues and sites of action. If the application or submission contains formulation bridging studies, send a consulting review request to the Clinical Pharmacology Team.

4. Human Food Safety (HFS) Reviews

HFS of new animal drug products intended for use in food-producing animals needs to be evaluated in the context of toxicology and residue chemistry. In addition, if the new animal drug products possess measurable antimicrobial activities, microbial food safety and potential impact on human intestinal flora should be evaluated.
a. Toxicology

Because limited information exists regarding how the physical and chemical properties of nanomaterials may influence safety, our recommendations on toxicology assessment would be on a case-by-case basis. However, the safety standard of reasonable certainty of no harm remains the same. The HFS reviewer refers the sponsor to the CVM GFI #149 for general toxicity study recommendations.

b. Residue Chemistry

The HFS reviewer refers the sponsor to CVM GFI #3 for a description of the residue chemistry studies to quantitate and characterize the residues in the edible tissues. CVM works with the sponsor to customize a development plan to characterize the distribution and potential accumulation of nanomaterials in the different edible tissues of food animals and in milk, eggs and honey.

c. Microbial Food Safety

The HFS reviewer informs the sponsor to address whether the new animal drug product has any adverse impact on emergence and development of antimicrobial resistance among food-borne pathogens and related commensal bacteria in the intestinal tract of food producing animals being treated with their proposed new animal drug product. The HFS reviewer refers the sponsor to CVM GFI #152.

The HFS reviewer informs the sponsor to provide an assessment to determine whether a microbiological acceptable daily intake (mADI) is needed for the new animal drug product that contains nanomaterial(s) or otherwise involves the use of nanotechnology. The HFS reviewer refers the sponsor to CVM GFI #159.

5. Chemistry, Manufacturing and Control (CMC) Reviews

The CMC reviewer uses the standard components of the CMC TS [21 CFR 514.1 or Common Technical Document (CTD) format] to review new animal drug products that contain nanomaterial(s) or otherwise involve the use of nanotechnology. CMC reviewers are encouraged to consult CDER/CBER's Guidance for Industry “Drug Products, Including Biological Products, that Contain Nanomaterials” as needed. Considerations for the finished new animal drug product include:

- chemical composition of nanomaterial(s) is clearly defined, including the choice of surfactant, emulsifier, stabilizer, dispersion agent, etc.;

- critical quality attributes (e.g., particle size distribution, drug loading, surface properties, purity, rate of release) are identified, characterized, and controlled using the appropriate analytical methods and equipment;

---

1 http://www.ich.org/products/ctd.html
• manufacturing and quality control measures are in place to ensure the low batch-to-batch variability; and

• appropriate stability-indicating tests are used to monitor the shelf-life of the nanomaterial(s) in the formulation (e.g., agglomeration, aggregation, or interaction with other ingredients of the formulation) are monitored.

6. Environmental Assessment Reviews

New animal drug products that contain nanomaterial(s) or otherwise involve the use of nanotechnology are evaluated using the same risk assessment paradigm for exposure and effects. Submission of an Environmental Assessment (EA) or a claim of categorical exclusion (CE) is required [21 CFR 25.15(a)]. Nanomaterial(s) may still be eligible for a CE under the existing regulations (21 CFR Part 25.33). The environmental reviewer ensures that sufficient information is included to conclude that extraordinary circumstances do not exist (21 CFR 25.21). If the new animal drug product does not qualify for a CE, an adequate EA must be submitted by the sponsor. That EA should be consistent with the recommendations in GFI #89 and possibly GFI #166.

B. JINAD

Because of the formulation complexity and unique targets of many nanotechnology-based new animal drug products, specialized approaches for determining bioequivalence to the reference listed new animal drug products and for analytical testing methods may be needed. The reviewer consults their TL, collaborates with other appropriate divisions and groups, and makes decisions on a case-by-case basis. This consideration also applies to submissions under the traditional ANADA process where no JINAD is submitted.

C. Supplemental NADAs and ANADAs

Look for any change in a drug substance or excipient of an approved (A)NADA that may involve replacement with a nanosized counterpart in a supplemental application. If the resulting product may be considered a new product for which a new approval (i.e., new original application) is needed (e.g., effectiveness and/or safety need to be re-assessed), consult your TL and see GFI #191.

D. Labeling

Reviewers evaluate the need for, and appropriateness of, any labeling statements related to nanomaterial(s) or nanotechnology on a case-by-case basis. In general, the use of nanomaterial(s) does not, by itself, trigger the need for special labeling for an ONADE-regulated drug product that contains nanomaterial(s) or otherwise involves the use of nanotechnology. However, there may be cases where additional labeling may need to be considered (e.g., for safe use of the product).

The reviewer informs the sponsor that a new dose or dosing regimen resulting from drug reformulation that contains nanomaterial(s) or otherwise involves the use of nanotechnology should be clearly identified in the labeling to avoid medication errors.

VI. VERSION HISTORY

August 30, 2011 – Final version

July 22, 2016 – Revisions made to references and updated to current format

July 18, 2019 – Updated to fix broken urls that were broke when FDA migrated to a new website. Added a new reference footnote 5 under section IV.A.5 and section V. Added CVM Nanotechnology WG’s email address under section III.

September 25, 2020 – An interactive form for reporting was created from the information formerly in Appendix I. Therefore, that appendix was removed from this document. Updated to include two screen shots of STARS to show how the document is identified as NANOTECH in STARS after the reporting and how to do a document search for NANOTECH documents.

January 27, 2022 – Quality system review conducted of the document and no updates or revisions were necessary at this time.

July 22, 2022 – Quality system review for minor formatting updates.

August 2, 2023 – minor edits to correct typographical errors, updating status of FDA 2019 GFI Drug Products, Including Biological Products, that Contain Nanomaterials, which is now final. As part of this process update, the ONADE Meeting Sign-In Sheet template is no longer necessary and it was retired. The font of this document was changed from Verdana 10-point font to Arial 11-point font. In order to bring all office quality system documentation into compliance with the FDA Visual Identity Program approved fonts, ONADE has adopted Arial 11-point font.
APPENDIX: YOU MIGHT HAVE A NANOTECHNOLOGY PRODUCT IF YOU SEE

A. Any of these terms in the submission²

   Micelle
   Liposome
   Dendrimer
   Carbon nanotube (CNT)
   Polymer
   Quantum dot
   Nanocrystal
   Fullerene
   Cyclodextrins

B. Or any reference to:

   Self-assembling
   Encapsulation
   Emulsification
   Pegylation
   Colloidal
   Micronized
   Drug delivery or carrier system
   Changing a compound’s solubility
   Long shelf life
   Novel and unexplained antimicrobial properties
   Increased effectiveness
   Reduced dose
   Radiographic contrast agents
   Flamel Technologies Medusa® Platform

² This list provides examples and is not meant to be exhaustive.
