Interpreting FilmArray BioThreat-E Test Results for Ebola

October 25, 2014

Dear Health Care Provider:

If you have received this Fact Sheet, it is because the U.S. Food and Drug Administration (FDA) has issued an Emergency Use Authorization (EUA) to authorize the use of the BioFire Defense FilmArray BioThreat-E test with the FilmArray Instrument to test for the presumptive presence of Ebola Zaire virus (detected in the West Africa outbreak in 2014) in whole blood and urine specimens from individuals with signs and symptoms of Ebola virus infection in conjunction with epidemiological risk factors.

FDA issued this EUA based on data submitted by BioFire Defense, LLC., to FDA and on the U.S. Secretary of Health and Human Services’ (HHS) declaration that circumstances exist to justify the emergency use of in vitro diagnostic tests for the detection of the Ebola virus. This EUA will terminate when the HHS Secretary’s declaration terminates, unless FDA revokes it sooner.

This test should be performed only on individuals with signs and symptoms of Ebola virus infection in conjunction with epidemiological risk factors.

The information in this Fact Sheet is the minimum necessary to inform you of the significant known and potential risks and benefits of the emergency use of the FilmArray BioThreat-E test. For more information on this EUA, please see FDA’s website at: http://www.fda.gov/MedicalDevices/Safety/EmergencySituations/ucm161496.htm

Why is this test needed at this time?

At this time, no FDA-approved/cleared tests that can detect Ebola Zaire virus (detected in the West Africa outbreak in 2014) in clinical specimens are available. BioFire Defense has developed the FilmArray BioThreat-E test to detect Ebola Zaire virus (detected in the West Africa outbreak in 2014) infections in the specified population.

If infection with Ebola Zaire virus (detected in the West Africa outbreak in 2014) is suspected based on current clinical and epidemiological screening criteria recommended by public health authorities, the FilmArray BioThreat-E test should be ordered only to presumptively diagnose Ebola Zaire virus (detected in the West Africa outbreak in 2014) infection. This test is authorized for use with whole blood and urine. Specimens should be collected with appropriate infection control precautions for Ebola viruses, according to the manufacturer’s instructions for the specimen collection device.

Use appropriate personal protective equipment when collecting and handling specimens from individuals suspected of having Ebola Zaire virus infection. These specimens should be shipped for analysis according to the specified shipping protocol only to laboratories certified under the Clinical Laboratory Improvement Amendments of 1988 (CLIA) to perform moderate complexity tests and to laboratories certified under CLIA to perform high complexity tests.

Current information about Ebola for health care workers, including case definitions and infection control, is available in the guideline, Infection Control for Viral Hemorrhagic Fevers in the African Health Care Setting, developed by the U.S. Centers for Disease Control and Prevention (CDC) in conjunction with the...
World Health Organization (WHO) and found at http://www.cdc.gov/vhf/abroad/healthcare-workers.html. All information and guidelines, including those on Ebola Zaire virus laboratory testing, may change as we continue to learn more about this virus. Please check the CDC Ebola website regularly for the most current information http://www.cdc.gov/vhf/ebola/index.html.

What does it mean if the specimen tests positive for Ebola Zaire virus?

A positive test result from the FilmArray BioThreat-E indicates that the patient is presumptively infected with the Ebola Zaire virus (detected in the West Africa outbreak in 2014). The test does not indicate the stage of infection, nor does it distinguish between different Ebola Zaire virus strains. Laboratory test results should always be considered in the context of clinical observations and epidemiologic data in making a final diagnosis.

The FilmArray BioThreat-E test has been designed to minimize the likelihood of false positive test results. However, in the event of a false positive result, the patient may be placed in isolation or in contact with other potentially infected/infected patients. While isolation or quarantine measures may likely already be in place for symptomatic persons meeting the case definition, there is a chance that quarantine may also be used for asymptomatic persons who test positive. All laboratories using this test must follow the recommended or standard confirmatory testing and reporting guidelines.

What does it mean if the specimen tests negative for Ebola Zaire virus?

A negative test presumes that Ebola Zaire virus (detected in the West Africa outbreak in 2014) was not present at the detection level of the assay. However, negative results do not preclude Ebola Zaire virus infection, and should not be used as the sole basis for treatment or other patient management decisions. The clinical features of the illness and the type and risk of exposure are the keys to making patient management and isolation decisions. A negative FilmArray BioThreat-E test result should not be interpreted as demonstrating that the patient does not have Ebola Zaire virus infection. The possibility of a false negative result should especially be considered if the patient’s recent exposures or clinical presentation indicate that Ebola Zaire virus infection is likely, and diagnostic tests for other causes of illness are negative.

Reporting Adverse Events

Any adverse events should be sent to the following website:

Give patients the Fact Sheet for Patients: Understanding Results from the FilmArray BioThreat-E Test for Ebola. (RFIT-PRT-0300)

Contact Information for Technical Assistance for the FilmArray BioThreat-E Test

BioFire Defense Technical Assistance
79 W 4500 S, Suite 14
Salt Lake City, UT 84107
Phone: 1-801-262-3592
Fax: 1-801-447-6907
support@biofiredefense.com
Health care providers will be contacted by BioFire Defense, LLC. in the event of any significant new findings observed during the course of the emergency use of the FilmArray BioThreat-E test.
