* Each sample consisted of 4 sub-samples (1 fish / filet, labeled here as A, B, C, and D, collected from 4 randomly selected containers). The lab results for all four sub-samples had to match the market name used on the product labeling for the sample to be considered properly labeled for species.

† Genus level identification reported because species level identification could not be achieved due to lack of an appropriate reference standard.

‡ Matched reference standard for *Lutjanus purpureus* (Caribbean Red Snapper) and *Lutjanus campechanus* (Red Snapper) as these two species cannot be distinguished with the gene used in this analysis.
