Budesonide/Formoterol Nebulizer Medications

With the increasing popularity of using a combination of a long-acting beta agonist and inhaled steroid in asthma and COPD, it is our pleasure to announce the availability of formoterol (long-acting beta agonist) and budesonide (inhaled steroid) together in a single unit dose vial through our compounding pharmacy services. This pairing is available as 12 mcg formoterol and 0.5 mg budesonide.

Considerations for Budesonide/Formoterol

- **Less Out-of-Pocket Expense-** Because our medication is used with a nebulizer, it is covered by the Medicare Part B program. This is especially helpful in patients that normally have to pay for their inhalers out-of-pocket which can be very expensive, even with their newly acquired drug card. Less out-of-pocket expense can lead to better compliance.
- **More Convenient for Patient-** A second benefit of the nebulizer is that patients that find it difficult to use an inhaler properly (shown by many studies to be well over half of patients), generally find it easier to take all inhaled medications via a single delivery system in the nebulizer. This is especially true for patients using multiple types of inhalers, all of which have unique instructions for proper use.
- **Clinical Studies Comparing Response to Other Steroid/Long-Acting Beta Agonist Combinations-** Several studies comparing the response of budesonide/formoterol with currently available steroid/long-acting beta agonist in asthma and COPD are very favorable. These abstracts are available to you at your request.

Switching your current patients to budesonide/formoterol is easy.

Provide us with a list of your current patients that have indications for this therapy and we will make all the arrangements for delivery direct to their home. Never hesitate to contact us if you have any further questions.
