RIBAVIRIN (ribavirin) monotherapy is not effective for the treatment of chronic hepatitis C virus infection and should not be used alone for this indication (see WARNINGS).

The primary clinical toxicity of ribavirin is hemolytic anemia. The anemia associated with ribavirin therapy may result in worsening of cardiac disease that has led to fatal and nonfatal myocardial infarctions. Patients with a history of significant or unstable cardiac disease should not be treated with ribavirin (see WARNINGS, ADVERSE REACTIONS, and DOSAGE AND ADMINISTRATION).

Significant teratogenic and/or embryocidal effects have been demonstrated in all animal species exposed to ribavirin. In addition, ribavirin has a multiple dose half-life of 12 days, and it may persist in non-plasma compartments for as long as 6 months. Ribavirin therapy is contraindicated in women who are pregnant and in the male partners of women who are pregnant. Extreme care must be taken to avoid pregnancy during therapy and for 6 months after completion of treatment in both female patients and in female partners of male patients who are taking ribavirin therapy. At least two reliable forms of effective contraception must be utilized during treatment and during the 6-month posttreatment follow-up period (see CONTRAINDICATIONS, WARNINGS, and PRECAUTIONS: Information for Patients, and Pregnancy: Category X).

DESCRIPTION

RIBAVIRIN is the XXXXX name for ribavirin, a nucleoside analogue with antiviral activity. The chemical name of ribavirin is 1-β-D-ribofuranosyl-1H-1,2,4-triazole-3-carboxamide and has the following structural formula:
The empirical formula of ribavirin is C$_{14}$H$_{15}$N$_{4}$O, and the molecular weight is 244.2. Ribavirin is a white to off-white powder. It is freely soluble in water and slightly soluble in anhydrous alcohol.

RIBAVIRIN (ribavirin) is available as a light pink to pink colored, flat, ovalshaped, film-coated tablet for oral administration. Each tablet contains 200 mg, 400 mg, 500mg, or 600mg of ribavirin and the following inactive ingredients: pregelatinized starch, microcrystalline cellulose, sodium starch glycolate, corn starch, and magnesium stearate. The coating of the tablet contains Chromatone-P® or Opadry® Pink (made by using hydroxypropyl methyl cellulose, talc, titanium dioxide, synthetic yellow iron oxide, and synthetic red iron oxide), ethyl cellulose (ECD-30), and triacetin.

**Mechanism of Action**

Ribavirin is a synthetic nucleoside analogue. The mechanism by which the combination of ribavirin and an interferon product exerts its effects against the hepatitis C virus has not been fully established.

**CLINICAL PHARMACOLOGY**

**Pharmacokinetics**

Multiple dose ribavirin pharmacokinetic data are available for HCV patients who received ribavirin in combination with peginterferon alfa-2a. Following administration of 1200 mg/day with food for 12 weeks mean±SD (n=39; body weight >75 kg) AUC$_{0-12hr}$ was 25,361±7110 ng·hr/mL and C$_{max}$ was 2748±818 ng/mL. The average time to reach C$_{max}$ was 2 hours. Trough ribavirin plasma concentrations following 12 weeks of dosing with food were 1662±545 ng/mL in HCV infected patients who received 800 mg/day (n=89), and 2112±810 ng/mL in patients who received 1200 mg/day (n=75; body weight >75 kg).

The terminal half-life of ribavirin following administration of a single oral dose of RIBAVIRIN is about 120 to 170 hours. The total apparent clearance following administration of a single oral dose of RIBAVIRIN is about 26 L/h. There is extensive accumulation of ribavirin after multiple dosing (twice daily) such that the C$_{max}$ at steady state was four-fold higher than that of a single dose.

**Effect of Food on Absorption of Ribavirin**

Bioavailability of a single oral dose of ribavirin was increased by coadministration with a high-fat meal. The absorption was slowed (T$_{max}$ was doubled) and the AUC$_{0-12hr}$ and C$_{max}$ increased by 42% and 66%, respectively, when RIBAVIRIN was taken with a high-fat meal compared with fasting conditions (see PRECAUTIONS and DOSAGE AND ADMINISTRATION).
Elimination and Metabolism
The contribution of renal and hepatic pathways to ribavirin elimination after administration of RIBAVIRIN is not known. In vitro studies indicate that ribavirin is not a substrate of CYP450 enzymes.

Special Populations

Race
There were insufficient numbers of non-Caucasian subjects studied to adequately determine potential pharmacokinetic differences between populations.

Renal Dysfunction
The pharmacokinetics of ribavirin following administration of RIBAVIRIN have not been studied in patients with renal impairment and there are limited data from clinical trials on administration of RIBAVIRIN in patients with creatinine clearance <50 mL/min. Therefore, patients with creatinine clearance <50 mL/min should not be treated with RIBAVIRIN (see WARNINGS and DOSAGE AND ADMINISTRATION).

Hepatic Impairment
The effect of hepatic impairment on the pharmacokinetics of ribavirin following administration of RIBAVIRIN has not been evaluated. The clinical trials of RIBAVIRIN were restricted to patients with Child-Pugh class A disease.

Pediatric Patients
Pharmacokinetic evaluations in pediatric patients have not been performed.

Elderly Patients
Pharmacokinetic evaluations in elderly patients have not been performed.

Gender
Ribavirin pharmacokinetics, when corrected for weight, are similar in male and female patients.

Drug Interactions
In vitro studies indicate that ribavirin does not inhibit CYP450 enzymes.

Nucleoside Analogues
Ribavirin has been shown in vitro to inhibit phosphorylation of zidovudine and stavudine which could lead to decreased antiretroviral activity. Exposure to didanosine or its active metabolite (dideoxyadenosine 5'-triphosphate) is increased when didanosine is co-administered with ribavirin, which could cause or worsen clinical toxicities (see PRECAUTIONS: Drug Interactions).
Clinical Studies
The safety and effectiveness of PEGASYS in combination with RIBAVIRIN for the treatment of hepatitis C virus infection were assessed in two randomized controlled clinical trials. All patients were adults, had compensated liver disease, detectable hepatitis C virus, liver biopsy diagnosis of chronic hepatitis, and were previously untreated with interferon. Approximately 20% of patients in both studies had compensated cirrhosis (Child-Pugh class A).

In study NV15801 (described as study 4 in the PEGASYS Package Insert), patients were randomized to receive either PEGASYS 180 µg sc once weekly (qw) with an oral placebo, PEGASYS 180 µg qw with RIBAVIRIN 1000 mg po (body weight <75 kg) or 1200 mg po (body weight =75 kg) or REBETRON™ (interferon alfa-2b 3 MIU sc tiw plus ribavirin 1000 mg or 1200 mg po). All patients received 48 weeks of therapy followed by 24 weeks of treatment-free follow-up. RIBAVIRIN or placebo treatment assignment was blinded. PEGASYS in combination with RIBAVIRIN resulted in a higher SVR (defined as undetectable HCV RNA at the end of the 24-week treatment-free follow-up period) compared to PEGASYS alone or interferon alfa-2b and ribavirin (Table 1). In all treatment arms, patients with viral genotype 1 regardless of viral load, had a lower response rate to PEGASYS in combination with RIBAVIRIN compared to patients with other viral genotypes.

Table 1 Sustained Virologic Response to Combination Therapy (Study NV15801*)

Difference in overall treatment response (PEGASYS/RIBAVIRIN – Interferon alfa-2b/ribavirin) was 9% (95% CI 2.3, 15.3).

* Described as study 4 in the PEGASYS Package Insert.

In study NV15942 (described as study 5 in the PEGASYS Package Insert), all patients received PEGASYS 180 µg sc qw and were randomized to treatment for either 24 or 48 weeks and to a RIBAVIRIN dose of either 800 mg or 1000 mg/1200 mg (for body weight <75 kg / =75 kg). Assignment to the four treatment arms was stratified by viral genotype and baseline HCV viral titer. Patients with genotype 1 and high viral titer (defined as >2 x 10⁶ HCV RNA copies/mL serum) were preferentially assigned to treatment for 48 weeks.
Genotype 1
Irrespective of baseline viral titer, treatment for 48 weeks with PEGASYS and 1000 mg or 1200 mg of RIBAVIRIN resulted in higher SVR (defined as undetectable HCV RNA at the end of the 24-week treatment-free follow-up period) compared to shorter treatment (24 weeks) and/or 800 mg RIBAVIRIN.

Genotype non-1
Irrespective of baseline viral titer, treatment for 24 weeks with PEGASYS and 800 mg of RIBAVIRIN resulted in a similar SVR compared to longer treatment (48 weeks) and/or 1000 mg or 1200 mg of RIBAVIRIN (see Table 2).

* Described as study 5 in the PEGASYS Package Insert.
** 1000 mg for body weight <75 kg; 1200 mg for body weight =75 kg.

Among the 36 patients with genotype 4, response rates were similar to those observed in patients with genotype 1 (data not shown). The numbers of patients with genotype 5 and 6 were too few to allow for meaningful assessment.

Treatment Response in Patient Subgroups
Treatment response rates are lower in patients with poor prognostic factors receiving pegylated interferon alpha therapy. In studies NV15801 and NV15942, treatment response rates were lower in patients older than 40 years (50% vs. 66%), in patients with cirrhosis (47% vs. 59%), in patients weighing over 85 kg (49% vs. 60%), and in patients with genotype 1 with high vs. low viral load (43% vs. 56%). African American patients had lower response rates compared to Caucasians.

Paired liver biopsies were performed on approximately 20% of patients in studies NV15801 and NV15942. Modest reductions in inflammation compared to baseline were seen in all treatment groups.

In studies NV15801 and NV15942, lack of early virologic response at 12
weeks (defined as HCV RNA undetectable or >2log10 lower than baseline) was grounds for discontinuation of treatment. Of patients who lacked an early viral response at 12 weeks and completed a recommended course of therapy despite a protocol-defined option to discontinue therapy, 5/39 (13%) achieved an SVR. Of patients who lacked an early viral response at 24 weeks, nineteen completed a full course of therapy and none achieved an SVR.

**INDICATIONS AND USAGE**
RIBAVIRIN in combination with PEGASYS (peginterferon alfa-2a) is indicated for the treatment of adults with chronic hepatitis C virus infection who have compensated liver disease and have not been previously treated with interferon alpha. Patients in whom efficacy was demonstrated included patients with compensated liver disease and histological evidence of cirrhosis (Child-Pugh class A).

**CONTRAINDICATIONS**
RIBAVIRIN (ribavirin) is contraindicated in:
- Patients with known hypersensitivity to RIBAVIRIN or to any component of the tablet.
- Women who are pregnant.
- Men whose female partners are pregnant.
- Patients with hemoglobinopathies (e.g., thalassemia major or sickle-cell anemia).

RIBAVIRIN and PEGASYS combination therapy is contraindicated in patients with:
- Autoimmune hepatitis.
- Hepatic decompensation (Child-Pugh class B and C) before or during treatment.

**WARNINGS**
RIBAVIRIN must not be used alone because ribavirin monotherapy is not effective for the treatment of chronic hepatitis C virus infection. The safety and efficacy of RIBAVIRIN have only been established when used together with PEGASYS (pegylated interferon alfa-2a, recombinant).

RIBAVIRIN and PEGASYS should be discontinued in patients who develop evidence of hepatic decompensation during treatment.

There are significant adverse events caused by RIBAVIRIN/PEGASYS therapy, including severe depression and suicidal ideation, hemolytic anemia, suppression of bone marrow function, autoimmune and infectious disorders, pulmonary dysfunction, pancreatitis, and diabetes.
The PEGASYS package insert and MEDICATION GUIDE should be reviewed in their entirety prior to initiation of combination treatment for additional safety information.

General
Treatment with RIBAVIRIN and PEGASYS should be administered under the guidance of a qualified physician and may lead to moderate to severe adverse experiences requiring dose reduction, temporary dose cessation or discontinuation of therapy.

Pregnancy
Ribavirin may cause birth defects and/or death of the exposed fetus. Extreme care must be taken to avoid pregnancy in female patients and in female partners of male patients. Ribavirin has demonstrated significant teratogenic and/or embryocidal effects in all animal species in which adequate studies have been conducted. These effects occurred at doses as low as one twentieth of the recommended human dose of ribavirin. RIBAVIRIN THERAPY SHOULD NOT BE STARTED UNLESS A REPORT OF A NEGATIVE PREGNANCY TEST HAS BEEN OBTAINED IMMEDIATELY PRIOR TO PLANNED INITIATION OF THERAPY. Patients should be instructed to use at least two forms of effective contraception during treatment and for at least six-months after treatment has been stopped. Pregnancy testing should occur monthly during RIBAVIRIN therapy and for six months after therapy has stopped (see CONTRAINDICATIONS and PRECAUTIONS: Information for Patients and Pregnancy: Category X).

Anemia
The primary toxicity of ribavirin is hemolytic anemia (hemoglobin <10 g/dL), which was observed in approximately 13% of RIBAVIRIN and PEGASYS treated patients in clinical trials (see PRECAUTIONS: Laboratory Tests). The anemia associated with RIBAVIRIN occurs within 1 to 2 weeks of initiation of therapy. BECAUSE THE INITIAL DROP IN HEMOGLOBIN MAY BE SIGNIFICANT, IT IS ADVISED THAT HEMOGLOBIN OR HEMATOCRIT BE OBTAINED PRETREATMENT AND AT WEEK 2 AND WEEK 4 OF THERAPY OR MORE FREQUENTLY IF CLINICALLY INDICATED. Patients should then be followed as clinically appropriate.

Fatal and nonfatal myocardial infarctions have been reported in patients with anemia caused by ribavirin. Patients should be assessed for underlying cardiac disease before initiation of ribavirin therapy. Patients with pre-existing cardiac disease should have electrocardiograms administered before treatment, and should be appropriately monitored during therapy. If there is any deterioration
of cardiovascular status, therapy should be suspended or discontinued (see DOSAGE AND ADMINISTRATION: RIBAVIRIN Dose Modification Guidelines). Because cardiac disease may be worsened by drug induced anemia, patients with a history of significant or unstable cardiac disease should not use RIBAVIRIN (see ADVERSE REACTIONS).

Pulmonary
Pulmonary symptoms, including dyspnea, pulmonary infiltrates, pneumonitis and occasional cases of fatal pneumonia, have been reported during therapy with ribavirin and interferon. In addition, sarcoidosis or the exacerbation of sarcoidosis has been reported. If there is evidence of pulmonary infiltrates or pulmonary function impairment, the patient should be closely monitored, and if appropriate, combination RIBAVIRIN/PEGASYS treatment should be discontinued.

Other
RIBAVIRIN and PEGASYS therapy should be suspended in patients with signs and symptoms of pancreatitis, and discontinued in patients with confirmed pancreatitis.

RIBAVIRIN should not be used in patients with creatinine clearance <50 mL/min (see CLINICAL PHARMACOLOGY: Special Populations).

RIBAVIRIN must be discontinued immediately and appropriate medical therapy instituted if an acute hypersensitivity reaction (e.g., urticaria, angioedema, bronchoconstriction, anaphylaxis) develops. Transient rashes do not necessitate interruption of treatment.

PRECAUTIONS
The safety and efficacy of RIBAVIRIN and PEGASYS therapy for the treatment of HIV infection, adenovirus, RSV, parainfluenza or influenza infections have not been established. RIBAVIRIN should not be used for these indications. Ribavirin for inhalation has a separate package insert, which should be consulted if ribavirin inhalation therapy is being considered.

The safety and efficacy of RIBAVIRIN and PEGASYS therapy have not been established in liver or other organ transplant patients, patients with decompensated liver disease due to hepatitis C virus infection, patients who are non-responders to interferon therapy or patients co-infected with HBV or HIV.

Information for Patients
Patients must be informed that ribavirin may cause birth defects and/or death of the exposed fetus. RIBAVIRIN therapy must not be used by
women who are pregnant or by men whose female partners are pregnant. Extreme care must be taken to avoid pregnancy in female patients and in female partners of male patients taking RIBAVIRIN therapy and for 6 months posttherapy. RIBAVIRIN therapy should not be initiated until a report of a negative pregnancy test has been obtained immediately prior to initiation of therapy. Patients must perform a pregnancy test monthly during therapy and for 6 months posttherapy.

Female patients of childbearing potential and male patients with female partners of childbearing potential must be advised of the teratogenic/embryocidal risks and must be instructed to practice effective contraception during RIBAVIRIN therapy and for 6 months posttherapy. Patients should be advised to notify the physician immediately in the event of a pregnancy (see CONTRAINDICATIONS and WARNINGS).

To monitor maternal-fetal outcomes of pregnant women exposed to RIBAVIRIN, the RIBAVIRIN Pregnancy Registry has been established. Physicians and patients are strongly encouraged to register by calling 1-800-526-6367.

The most common adverse event associated with ribavirin is anemia, which may be severe (see ADVERSE REACTIONS). Patients should be advised that laboratory evaluations are required prior to starting RIBAVIRIN therapy and periodically thereafter (see Laboratory Tests). It is advised that patients be well hydrated, especially during the initial stages of treatment. Patients who develop dizziness, confusion, somnolence, and fatigue should be cautioned to avoid driving or operating machinery.

Patients should be informed regarding the potential benefits and risks attendant to the use of RIBAVIRIN. Instructions on appropriate use should be given, including review of the contents of the enclosed MEDICATION GUIDE, which is not a disclosure of all or possible adverse effects.

Patients should be advised to take RIBAVIRIN with food.

**Laboratory Tests**
Before beginning RIBAVIRIN therapy, standard hematological and biochemical laboratory tests must be conducted for all patients. Pregnancy screening for women of childbearing potential must be done.

After initiation of therapy, hematological tests should be performed at 2 weeks and 4 weeks and biochemical tests should be performed at 4 weeks. Additional testing should be performed periodically during therapy. Monthly pregnancy testing should be done during combination therapy and for 6 months after discontinuing therapy.
The entrance criteria used for the clinical studies of RIBAVIRIN and PEGASYS combination therapy may be considered as a guideline to acceptable baseline values for initiation of treatment:

- Platelet count = 90,000 cells/mm³
- Absolute neutrophil count (ANC) = 1500 cells/mm³
- TSH and T4 within normal limits or adequately controlled thyroid function
- ECG (see WARNINGS)

The maximum drop in hemoglobin usually occurred during the first 8 weeks of initiation of RIBAVIRIN therapy. Because of this initial acute drop in hemoglobin, it is advised that a complete blood count should be obtained pretreatment and at week 2 and week 4 of therapy or more frequently if clinically indicated. Additional testing should be performed periodically during therapy. Patients should then be followed as clinically appropriate.

**Drug Interactions**

Results from a pharmacokinetic sub-study demonstrated no pharmacokinetic interaction between PEGASYS (peginterferon alfa-2a) and ribavirin.

**Nucleoside Analogues**

*Didanosine*

Coadministration of RIBAVIRIN and didanosine is not recommended. Reports of fatal hepatic failure, as well as peripheral neuropathy, pancreatitis, and symptomatic hyperlactatemia/lactic acidosis have been reported in clinical trials (see CLINICAL PHARMACOLOGY: Drug Interactions).

*Stavudine and Zidovudine*

Ribavirin can antagonize the in vitro antiviral activity of stavudine and zidovudine against HIV. Therefore, concomitant use of ribavirin with either of these drugs should be avoided (see CLINICAL PHARMACOLOGY: Drug Interactions).

**Carcinogenesis, Mutagenesis, Impairment of Fertility**

**Carcinogenesis**

The carcinogenic potential of ribavirin has not been fully determined. In a p53 (+/-) mouse carcinogenicity study at doses up to the maximum tolerated dose of 100 mg/kg/day, ribavirin was not oncogenic. However, on a body surface area basis, this dose was 0.5 times maximum recommended human 24-hour dosc of ribavirin. A study to assess the carcinogenic potential of ribavirin in rats is ongoing.
Mutagenesis
Ribavirin demonstrated mutagenic activity in the in vitro mouse lymphoma assay. No clastogenic activity was observed in an in vivo mouse micronucleus assay at doses up to 2000 mg/kg. However, results from studies published in the literature show clastogenic activity in the in vivo mouse micronucleus assay at oral doses up to 2000 mg/kg. A dominant lethal assay in rats was negative, indicating that if mutations occurred in rats they were not transmitted through male gametes. However, potential carcinogenic risk to humans cannot be excluded.

Impairment of Fertility
In a fertility study in rats, ribavirin showed a marginal reduction in sperm counts at the dose of 100 mg/kg/day with no effect on fertility. Upon cessation of treatment, total recovery occurred after 1 spermatogenesis cycle. Abnormalities in sperm were observed in studies in mice designed to evaluate the time course and reversibility of ribavirin-induced testicular degeneration at doses of 15 to 150 mg/kg/day (approximately 0.1-0.8 times the maximum recommended human 24-hour dose of ribavirin) administered for 3 to 6 months. Upon cessation of treatment, essentially total recovery from ribavirin induced testicular toxicity was apparent within 1 or 2 spermatogenic cycles.

Female patients of childbearing potential and male patients with female partners of childbearing potential should not receive RIBAVIRIN unless the patient and his/her partner are using effective contraception (two reliable forms). Based on a multiple dose half-life (t1/2) of ribavirin of 12 days, effective contraception must be utilized for 6 months posttherapy (i.e., 15 half-lives of clearance for ribavirin).

No reproductive toxicology studies have been performed using PEGASYS in combination with RIBAVIRIN. However, peginterferon alfa-2a and ribavirin when administered separately, each has adverse effects on reproduction. It should be assumed that the effects produced by either agent alone would also be caused by the combination of the two agents.

Pregnancy
Pregnancy: Category X (see CONTRAINDICATIONS)
Ribavirin produced significant embryocidal and/or teratogenic effects in all animal species in which adequate studies have been conducted. Malformations of the skull, palate, eye, jaw, limbs, skeleton, and gastrointestinal tract were noted. The incidence and severity of teratogenic effects increased with escalation of the drug dose. Survival of fetuses and offspring was reduced.
In conventional embryotoxicity/teratogenicity studies in rats and rabbits, observed no effect dose levels were well below those for proposed clinical use (0.3 mg/kg/day for both the rat and rabbit; approximately 0.06 times the recommended human 24-hour dose of ribavirin). No maternal toxicity or effects on offspring were observed in a peri/postnatal toxicity study in rats dosed orally at up to 1 mg/kg/day (approximately 0.01 times the maximum recommended human 24-hour dose of ribavirin).

Treatment and Posttreatment: Potential Risk to the Fetus
Ribavirin is known to accumulate in intracellular components from where it is cleared very slowly. It is not known whether ribavirin is contained in sperm, and if so, will exert a potential teratogenic effect upon fertilization of the ova. In a study in rats, it was concluded that dominant lethality was not induced by ribavirin at doses up to 200 mg/kg for 5 days (up to 1.7 times the maximum recommended human dose of ribavirin). However, because of the potential human teratogenic effects of ribavirin, male patients should be advised to take every precaution to avoid risk of pregnancy for their female partners.

RIBAVIRIN should not be used by pregnant women or by men whose female partners are pregnant. Female patients of childbearing potential and male patients with female partners of childbearing potential should not receive RIBAVIRIN unless the patient and his/her partner are using effective contraception (two reliable forms) during therapy and for 6 months posttherapy.

To monitor maternal-fetal outcomes of pregnant women exposed to RIBAVIRIN, the RIBAVIRIN Pregnancy Registry has been established. Physicians and patients are strongly encouraged to register by calling 1-800-526-6367.

Animal Toxicology
Long-term study in the mouse and rat (18-24 months; dose 20-75 and 10-40 mg/kg/day, respectively; approximately 0.1-0.4 times the maximum human daily dose of ribavirin) have demonstrated a relationship between chronic ribavirin exposure and an increased incidence of vascular lesions (microscopic hemorrhages) in mice. In rats, retinal degeneration occurred in controls, but the incidence was increased in ribavirin-treated rats.

Nursing Mothers
It is not known whether ribavirin is excreted in human milk. Because many drugs are excreted in human milk and to avoid any potential for serious adverse reactions in nursing infants from ribavirin, a decision should be made either to discontinue nursing or therapy with RIBAVIRIN, based on the importance of the therapy to the mother.
Pediatric Use
Safety and effectiveness of RIBAVIRIN have not been established in patients below the age of 18.

Geriatric Use
Clinical studies of RIBAVIRIN and PEGASYS did not include sufficient numbers of subjects aged 65 or over to determine whether they respond differently from younger subjects. Specific pharmacokinetic evaluations for ribavirin in the elderly have not been performed. The risk of toxic reactions to this drug may be greater in patients with impaired renal function. RIBAVIRIN should not be administered to patients with creatinine clearance <50 mL/min. (see CLINICAL PHARMACOLOGY: Special Populations).

Effect of Gender
No clinically significant differences in the pharmacokinetics of ribavirin were observed between male and female subjects.

ADVERSE REACTIONS
PEGASYS in combination with RIBAVIRIN causes a broad variety of serious adverse reactions (see BOXED WARNING and WARNINGS). In all studies, one or more serious adverse reactions occurred in 10% of patients receiving PEGASYS in combination with RIBAVIRIN.

The most common life-threatening or fatal events induced or aggravated by PEGASYS and RIBAVIRIN were depression, suicide, relapse of drug abuse/overdose, and bacterial infections; each occurred at a frequency of <1%.

Nearly all patients in clinical trials experienced one or more adverse events. The most commonly reported adverse reactions were psychiatric reactions, including depression, irritability, anxiety, and flu-like symptoms such as fatigue, pyrexia, myalgia, headache and rigors.

Ten percent of patients receiving 48 weeks of therapy with PEGASYS in combination with RIBAVIRIN discontinued therapy. The most common reasons for discontinuation of therapy were psychiatric, flu-like syndrome (e.g., lethargy, fatigue, headache), dermatologic and gastrointestinal disorders.

The most common reason for dose modification in patients receiving combination therapy was for laboratory abnormalities; neutropenia (20%) and thrombocytopenia (4%) for PEGASYS and anemia (22%) for RIBAVIRIN.
PEGASYS dose was reduced in 12% of patients receiving 1000 mg to 1200 mg RIBAVIRIN for 48 weeks and in 7% of patients receiving 800 mg RIBAVIRIN for 24 weeks. RIBAVIRIN dose was reduced in 21% of patients receiving 1000 mg to 1200 mg RIBAVIRIN for 48 weeks and 12% in patients receiving 800 mg RIBAVIRIN for 24 weeks.

Because clinical trials are conducted under widely varying and controlled conditions, adverse reaction rates observed in clinical trials of a drug cannot be directly compared to rates in the clinical trials of another drug. Also, the adverse event rates listed here may not predict the rates observed in a broader patient population in clinical practice.

* Described as study 4 in the PEGASY5 Package Insert.
** Severe hematologic abnormalities

Patients treated for 24 weeks with PEGASYS and 800 mg RIBAVIRIN were observed to have lower incidence of serious adverse events (3% vs. 10%), hemoglobin <10g/dL (3% vs. 15%), dose modification of PEGASYS (30% vs. 36%) and RIBAVIRIN (19% vs. 38%) and of withdrawal from treatment (5% vs. 15%) compared to patients treated for 48 weeks with PEGASYS and 1000 mg or 1200 mg RIBAVIRIN. On the other hand the overall incidence of adverse events appeared to be similar in the two treatment groups.
The most common serious adverse event (3%) was bacterial infection (e.g., sepsis, osteomyelitis, endocarditis, pyelonephritis, pneumonia). Other serious adverse events occurred at a frequency of <1% and included: suicide, suicidal ideation, psychosis, aggression, anxiety, drug abuse and drug overdose, angina, hepatic dysfunction, fatty liver, cholangitis, arrhythmia, diabetes mellitus, autoimmune phenomena (e.g., hyperthyroidism, hypothyroidism, sarcoidosis, systemic lupus erythematosus, rheumatoid arthritis) peripheral neuropathy, aplastic anemia, peptic ulcer, gastrointestinal bleeding, pancreatitis, colitis, corneal ulcer, pulmonary embolism, coma, myositis, and cerebral hemorrhage.

**Laboratory Test Values**
Anemia due to hemolysis is the most significant toxicity of ribavirin therapy. Anemia (hemoglobin <10 g/dL) was observed in 13% of RIBAVIRIN and PEGASYS combination-treated patients in clinical trials. The maximum drop in hemoglobin occurred during the first 8 weeks of initiation of ribavirin therapy (see DOSAGE AND ADMINISTRATION: Dose Modifications).

**OVERDOSE**
No cases of overdose with RIBAVIRIN have been reported in clinical trials.

**DOSAGE AND ADMINISTRATION**
The recommended dose of RIBAVIRIN tablets is provided in Table 4. The recommended duration of treatment for patients previously untreated with ribavirin and interferon is 24 to 48 weeks.

The daily dose of RIBAVIRIN is 800 mg to 1200 mg administered orally in two divided doses. The dose should be individualized to the patient depending on baseline disease characteristics (e.g., genotype), response to therapy, and tolerability of the regimen (see Table 4).

In the pivotal clinical trials, patients were instructed to take RIBAVIRIN with food; therefore, patients are advised to take RIBAVIRIN with food.

**Table 4**

<table>
<thead>
<tr>
<th>Genotype</th>
<th>PEGASYS Dose</th>
<th>RIBAVIRIN Dose</th>
<th>Duration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Genotype 1, 4</td>
<td>180 μg</td>
<td>&lt;75 kg = 1000 mg</td>
<td>48 weeks</td>

<td>≥75 kg = 1200 mg</td>
<td>48 weeks</td>
</tr>
<tr>
<td>Genotype 2, 3</td>
<td>180 μg</td>
<td>800 mg</td>
<td>24 weeks</td>
</tr>
</tbody>
</table>

Genotypes non-1 showed no increased response to treatment beyond 24 weeks (see Table 2). Data on genotypes 5 and 6 are insufficient for dosing recommendations.

**Dose Modifications**
If severe adverse reactions or laboratory abnormalities develop during combination RIBAVIRIN/PEGASYS therapy, the dose should be modified
or discontinued, if appropriate, until the adverse reactions abate. If intolerance persists after dose adjustment, RIBAVIRIN/PEGASYS therapy should be discontinued.

RIBAVIRIN should be administered with caution to patients with pre-existing cardiac disease (see Table 5). Patients should be assessed before commencement of therapy and should be appropriately monitored during therapy. If there is any deterioration of cardiovascular status, therapy should be stopped (see WARNINGS).

### Table 5  RIBAVIRIN Dosage Modification Guidelines

</tr>
</tbody>
</table>

* One 200 mg tablet in the morning and two 200 mg tablets in the evening.

Once RIBAVIRIN has been withheld due to either a laboratory abnormality or clinical manifestation, an attempt may be made to restart RIBAVIRIN at 600 mg daily and further increase the dose to 800 mg daily depending upon the physician’s judgment. However, it is not recommended that RIBAVIRIN be increased to its original assigned dose (1000 mg to 1200 mg).

Renal Impairment

RIBAVIRIN should not be used in patients with creatinine clearance <50 mL/min (see WARNINGS and CLINICAL PHARMACOLOGY: Special Populations).

**HOW SUPPLIED**

RIBAVIRIN (ribavirin) is available as tablets for oral administration. Each tablet contains either 200 mg, 400 mg, 500 mg, or 600 mg of ribavirin and is light pink to pink colored, flat, oval-shaped, film-coated, and engraved with RIBA on one side and XXXXX on the other side. They are packaged as bottle of 168 tablets (NDC 0000-0001-01), (NDC 0000-0002-01), (NDC 0000-0003-01), (NDC 0000-0004-01).

**Storage Conditions**

Store the RIBAVIRIN Tablets bottle at 25°C (77°F); excursions are permitted between 15° and 30°C (59° and 86°F) [see USP Controlled Room Temperature]. Keep bottle tightly closed.
MEDICATION GUIDE
RIBAVIRIN
(ribavirin)
Tablets

Read this Medication Guide carefully before you start taking RIBAVIRIN and read the Medication Guide each time you get more RIBAVIRIN. There may be new information. This information does not take the place of talking to your healthcare provider about your medical condition or your treatment.

What is the most important information I should know about RIBAVIRIN?

1. RIBAVIRIN may cause birth defects or death of an unborn child. Therefore, if you are pregnant or your sexual partner is pregnant or plans to become pregnant, do not take RIBAVIRIN. If you could become pregnant, you must not become pregnant while taking RIBAVIRIN and for 6 months after you have stopped treatment with RIBAVIRIN. During this time you must use 2 forms of birth control, and you must have pregnancy tests that show you are not pregnant.

Female sexual partners of male patients being treated with RIBAVIRIN must not become pregnant during treatment and for 6 months after treatment has stopped. You must use 2 forms of birth control during this time.

If pregnancy occurs, report the pregnancy to your healthcare provider right away. (See "What should I avoid while taking RIBAVIRIN?")

2. RIBAVIRIN can cause a dangerous drop in your red blood cell count. RIBAVIRIN can cause anemia, which is a decrease in the number of red blood cells. This can be dangerous, especially if you have heart or breathing problems. This may cause a worsening of heart (cardiovascular) or circulatory problems. Some patients may get chest pain and rarely, a heart attack. Patients with a history of heart disease have the highest chance of this. Tell your healthcare provider, before taking RIBAVIRIN if you have or have ever had any heart or breathing problems. Your healthcare provider should check your red blood cell count before you start treatment with RIBAVIRIN and often during the first 4 weeks of treatment. Your red blood cell count may be done more often if you have any heart or breathing problems.
3. Do not take RIBAVIRIN alone to treat hepatitis C virus infection. RIBAVIRIN does not treat hepatitis C virus infections by itself. RIBAVIRIN should be used in combination with PEGASYS® (peginterferon alfa-2a) to treat continuing (chronic) hepatitis C virus infections. You should read the Medication Guide for PEGASYS because it has additional important information about treatment that is not covered in this Medication Guide. Your healthcare provider or pharmacist should give you a copy of the PEGASYS Medication Guide.

**What is RIBAVIRIN?**

RIBAVIRIN is an antiviral medicine. It is used in combination with a medicine called PEGASYS® (peginterferon alfa-2a) to treat some adults with chronic hepatitis C whose liver still works normally, and who have not been treated before with a medicine called an interferon alpha. It is not known how RIBAVIRIN and PEGASYS work together to fight hepatitis C virus infections.

It is not known if treatment with RIBAVIRIN and PEGASYS combination therapy can cure hepatitis C or if it can prevent liver damage (cirrhosis), liver failure or liver cancer that is caused by hepatitis C virus infections. It is not known if treatment with RIBAVIRIN and PEGASYS combination therapy will prevent an infected person from spreading the hepatitis C virus to another person. Treatment with RIBAVIRIN has not been studied in children under 18 years of age.

**Who should not take RIBAVIRIN?**

Do not use RIBAVIRIN if:

- You are a female and you are pregnant or plan to become pregnant during treatment or during the 6 months after your treatment has ended. (See “What is the most important information I should know about RIBAVIRIN?” and “What should I avoid while taking RIBAVIRIN?”)

- You are a male patient with a female sexual partner who is pregnant or plans to become pregnant at any time while you are being treated with RIBAVIRIN or during the 6 months after your treatment has ended. (See “What is the most important information I should know about RIBAVIRIN?” and “What should I avoid while taking RIBAVIRIN?”)

- You are breast feeding. We do not know if RIBAVIRIN can pass through your milk and if it can harm your baby. You will need
to choose either to breast feed or take RIBAVIRIN, but not both.

- You have a liver disease called autoimmune hepatitis (hepatitis caused by your immune system attacking your liver).

- You have unstable or advanced liver disease.

- You are allergic to any of the ingredients in RIBAVIRIN. The active ingredient in RIBAVIRIN is ribavirin. See the end of this Medication Guide for a list of all the ingredients in RIBAVIRIN.

Tell your healthcare provider before starting treatment with RIBAVIRIN in combination with PEGASYS (see also the PEGASYS Medication Guide) if you have any of the following medical conditions:

- mental health problems, such as depression or anxiety: RIBAVIRIN and PEGASYS combination therapy may make them worse. Tell your healthcare provider if you are being treated or had treatment in the past for any mental problems, including depression, thoughts of ending your life (suicidal thoughts) or a feeling of loss of contact with reality, such as hearing voices or seeing things that are not there (psychosis). Tell your healthcare provider if you take any medicines for these problems.

- high blood pressure, heart problems or have had a heart attack. RIBAVIRIN may worsen heart problems such as high blood pressure, increased heart rate, and chest pain. Tell your healthcare provider if you have or had a heart problem. Patients who have had certain heart problems should not take RIBAVIRIN.

- blood disorders, including anemia (low red blood cell count), thalassemia (Mediterranean anemia) and sickle-cell anemia. RIBAVIRIN can reduce the number of red blood cells you have. This may make you feel dizzy or weak and could worsen any heart problems you might have.

- kidney problems. If your kidneys do not work properly, you may have worse side effects from RIBAVIRIN treatment and require a lower dose.

- liver problems (other then hepatitis C virus infection).

- organ transplant, and you are taking medicine that keeps your body from rejecting your transplant (suppresses your immune system).
• **thyroid disease.** RIBAVIRIN and PEGASYS combination therapy may make your thyroid disease worse or harder to treat. RIBAVIRIN and PEGASYS treatment may be stopped if you develop thyroid problems that cannot be controlled by medicine.

• **have or had drug or alcohol addiction or abuse.**

• **cancer.**

• **infection with hepatitis B virus and/or human immunodeficiency virus (HIV, the virus that causes AIDS).**

• **diabetes.** RIBAVIRIN and PEGASYS combination therapy may make your diabetes worse or harder to treat.

• **past interferon treatment for hepatitis C virus infection that did not work for you.**

Tell your healthcare provider about all the medicines you take, including prescription and non-prescription medicines, vitamins, and herbal supplements. Some medicines can cause serious side effects if taken while you also take RIBAVIRIN. Some medicines may affect how RIBAVIRIN works or RIBAVIRIN may affect how your other medicines work. Be especially sure to tell your healthcare provider if you take any medicines to treat HIV.

For more information see the PEGASYS Medication Guide.

**How should I take RIBAVIRIN?**

• Your healthcare provider will determine the right dose of RIBAVIRIN based on your weight.

• Take RIBAVIRIN 1 time in the morning and 1 time at night (2 times a day). Take RIBAVIRIN the same 2 times each day.

• Take RIBAVIRIN with food.

• It is very important to follow your dosing schedule and your healthcare provider’s instructions on how to take your medicines.

• Take RIBAVIRIN for as long as it is prescribed, and do not take more than your healthcare provider prescribes.

• If you miss a dose of RIBAVIRIN and remember the same day, take the missed dose as soon as you remember. If the whole day has passed, ask your healthcare provider what to do. Do not take 2 doses at the same time.

• Your healthcare provider may adjust your dose of RIBAVIRIN based on blood tests that show your response to treatment and side effects you may have.
• Females taking RIBAVIRIN or female sexual partners of male patients taking RIBAVIRIN must have a pregnancy test:
  • before treatment begins
  • every month during treatment
  • for 6 months after treatment ends to make sure there is no pregnancy

It is also important not to use other ribavirin medicines without talking to your healthcare provider. Please see the PEGASYS Medication Guide for the proper use of PEGASYS injection.

What should I avoid while taking RIBAVIRIN?

Avoid the following during RIBAVIRIN treatment:
• Do not get pregnant. If you or your sexual partner get pregnant during treatment with RIBAVIRIN or in the 6 months after treatment ends, tell your healthcare provider right away. (See "What is the most important information I should know about treatment with RIBAVIRIN?")

Talk with your healthcare provider about birth control methods and how to avoid pregnancy. You must use extreme care to avoid pregnancy during RIBAVIRIN treatment and for 6 months after treatment in female and male patients.

If you or your sexual partner get pregnant while on RIBAVIRIN or during the 6 months after your treatment ends, you must report the pregnancy to your healthcare provider right away. Your healthcare provider should call XXXXXX, the company that makes RIBAVIRIN, at 1-800-555-5555. Your healthcare provider will be asked to give follow-up information about the pregnancy. Any information about your pregnancy that is reported about you will be kept private (confidential).

• Do not take RIBAVIRIN alone to treat your hepatitis C virus infection. RIBAVIRIN should be used in combination with PEGASYS (peginterferon alfa-2a) to treat chronic hepatitis C virus infections. (See "What is the most important information I should know about treatment with RIBAVIRIN?")
• Do not breast-feed. RIBAVIRIN may pass through your milk and may harm your baby.
• Do not drink alcohol, including beer, wine, and liquor. This may make your liver disease worse.
• Do not drive or operate machinery if RIBAVIRIN makes you feel tired, dizzy or confused.
• Do not take other medicines unless your healthcare provider knows about them. Take only medicines prescribed or approved by your healthcare provider. These include prescription and non-
prescription medicines, vitamins, and herbal supplements. Talk to your healthcare provider before starting any new medicine.

What are the possible side effects of RIBAVIRIN?

The most serious possible side effects of RIBAVIRIN are:

- **Harm to unborn children.** RIBAVIRIN may cause birth defects or death of an unborn child. (For more details, see "What is the most important information I should know about RIBAVIRIN?")
- **Anemia.** Anemia is a reduction in the number of red blood cells you have. Anemia can be dangerous, especially if you have heart or breathing problems. Tell your healthcare provider right away if you feel tired, have chest pain or shortness of breath. These may be signs of low red blood cell counts.

Call your healthcare provider right away if you have any of the following symptoms. They may be signs of a serious side effect of RIBAVIRIN and PEGASYS treatment.

- trouble breathing
- hives or swelling
- chest pain
- severe stomach pain or low back pain
- bloody diarrhea or bloody stools (bowel movements). These may look like black tar.
- bruising or unusual bleeding
- change in your vision
- high fever (temperature greater than 100.5°F)
- you have psoriasis (a skin disease) and it gets worse
- you become very depressed or think about suicide (ending your life)

The most common side effects of RIBAVIRIN are likely to be the same as for other ribavirin products. These are:

- feeling tired
- nausea and appetite loss
- rash and itching
- cough

These are not all the possible side effects of RIBAVIRIN treatment. For more information, ask your doctor or pharmacist and see the PEGASYS Medication Guide.
What should I know about hepatitis C infection?
Hepatitis C infection is a disease caused by a virus that infects the liver. Hepatitis C is more serious for some people than others. Most people who get hepatitis C carry the virus in their blood for the rest of their lives. Most of these people will have some liver damage, but many do not feel sick from the disease. In some people, the liver becomes badly damaged and scarred. This is called cirrhosis. Cirrhosis can cause the liver to stop working. Some people may get liver cancer or liver failure from the hepatitis C virus.

Hepatitis C virus is spread from one person to another by contact with an infected person’s blood. You should talk to your healthcare provider about ways to prevent you from infecting others.

How should I store RIBAVIRIN?
Store RIBAVIRIN tablets at room temperature (77°F).
Please refer to the PEGASYS Medication Guide for storage information about PEGASYS injection.

General information about the safe and effective use of RIBAVIRIN
Medicines are sometimes prescribed for purposes other than those listed in a Medication Guide. Do not use RIBAVIRIN for a condition for which it was not prescribed. Do not give RIBAVIRIN to other people, even if they have the same symptoms that you have.

This Medication Guide summarizes the most important information about RIBAVIRIN. If you would like more information, talk with your healthcare provider. You can ask your healthcare provider or pharmacist for information about RIBAVIRIN that is written for healthcare professionals.

What are the ingredients in RIBAVIRIN?
Active Ingredient: ribavirin

Inactive Ingredients: pregelatinized starch, sodium starch glycolate, cornstarch, microcrystalline cellulose, and magnesium stearate. The tablet is coated with aquacoat ECD-30, triacetin, and colored with a coating system composed of hydroxypropyl methyl cellulose, talc, titanium dioxide, synthetic yellow iron oxide, and synthetic red iron oxide.
