Subject: Mid-cycle Review of CMC information in CSL Behring's original BLA for Factor XIII Concentrate (Human)

This memorandum summarizes the review of CMC information in an original biologics license application (BLA) with STN 125385 submitted by CSL Behring (CSLB) for plasma-derived Coagulation Factor XIII (FXIII) Concentrate (Human). The proposed indication for this product is for routine prophylactic treatment of congenital Factor XIII deficiency.

Upon review, I identified a few deficiencies in this submission, and will need to request from CSLB additional information as summarized at the end of this memo.

Background

FXIII is a plasma proenzyme composed of four polypeptides: two A subunits and two B subunits. FXIII is activated in the presence of calcium ions by thrombin cleavage of the A-subunit to become active enzyme FXIIIa, which covalently cross-links fibrin molecules to each other. FXIII is essential for normal coagulation, wound healing, and the physiological protection of the clot against fibrinolysis.

FXIII Concentrate (Human) is a sterile, preservative-free, heat-treated, lyophilized plasma protein product made from pooled US-sourced human plasma. It is manufactured in the CSLB facility in Marburg, Germany. This product has been marketed in the UK since 1976 and subsequently licensed in other 12 countries worldwide. ---b(4)----------
---
Pasteurization was introduced as a virus inactivation step in 1981. More recently, a process upgrade for the production of FXIII Concentrate was introduced to improve the process and safety profile of the product, such as the use of ----------
---(b)(4)----------.

CSLB submitted the BLA for FXIII Concentrate (Human) under the accelerated approval program using FXIII activity trough levels as the surrogate endpoint, and is indicated for

routine prophylactic treatment of congenital FXIII deficiency. Of note, CSLB outlined a manufacturing plan that included an ----------(b)(4)---------- based on the teleconference between the FDA and CSLB dated 4 May 2010. This manufacturing change is proposed to be submitted as a prior approval supplement once the data is available.

Summary of Review

DRUG SUBSTANCE

1. Manufacture

1) Manufacturer

The manufacture of FXIII Concentrate (Human) starting from plasma to the FXIII final bulk solution (drug substance, DS) is performed at CSL Behring GmbH, Emil-von-Behring-Str.76, 35041 Marburg, Germany.

2) A brief description of manufacturing process and process controls

8) Control of Materials

- Starting material - Human plasma

  FXIII Concentrate is exclusively produced from human plasma obtained from the FDA approved US plasmapheresis centers.

  The plasma is tested according to the following principles:

  The plasma donations used for FXIII Concentrate (Human) have been tested negative for serological markers (mandatory testing for HBsAg, antibodies against HIV-1/2 and HCV).

2. Characterization

1) Elucidation of structure and other characteristics

- Structure

  FXIII is the zymogenic form of the glutaminyl-peptide γ-glutamyl transferase factor XIIIa. Plasma-derived FXIII is a 320 kDa hetero-tetramer (A2B2), which is the product of two separate genes coding for A and B chains. The A chain is composed of 730 amino acids (83 kDa) and dimerizes forming a non-glycosylated globular molecule. It is also found intracellularly in monocytes, macrophages, platelets, megacaryocytes. All FXIII-A2 molecules found in plasma exist in the hetero-tetrameric form in complex with FXIII-B2. The FXIII-A chain has nine free sulfhydryl groups, including the active site with Cys314. The A chain also contains an activation peptide, the catalytic triad, a calcium binding site, fibrin-binding, and substrate-recognition domains. The B chains are secreted by hepatocytes, and complex rapidly with the A2 subunits but also circulate in the homo-dimeric form in plasma. The plasma FXIII-A2B2 complex is present at a concentration of 14 ~ 28 mg/L plasma according to ELISA data (Murdock et al, 1992).

  FXIII is one of the zymogens to become activated in the coagulation cascade and it is the only enzyme in this system that is not a serine protease. The conversion of plasma FXIII to FXIIIa (A2') results from hydrolysis of the Arg36-Gly37 at the NH_2-terminus of the A subunit by thrombin. Full expression of activity is achieved only after the Ca^{2+} and fibrin(ogen) dependent dissociation of the B subunit dimer from the A2' dimer.

- Function

  In the coagulation cascade, FXIIIa functions to stabilize the fibrin clot by crosslinking the α- and γ-chains of fibrin. Other proteins known to be substrates for FXIIIa which may be hemostatically important include fibronectin, α2-antiplasmin, collagen, Coagulation Factor V, von Willebrand Factor, and thrombospondin. Cross-linked fibrin is the end result of the coagulation cascade, and provides tensile strength to a primary hemostatic platelet plug.

DRUG PRODUCT

1. *Description and Composition of the drug product*

FXIII Concentrate (Human) is a highly purified, pasteurized, lyophilized substance containing the active ingredient, human coagulation FXIII 1000 - 1600 IU per vial for the US market. Human albumin, glucose, sodium chloride, and sodium hydroxide serve as excipients.

The presentation consists of one vial with the lyophilized FXIII DP, and one vial with a diluent (Sterile WFI, sWFI). Furthermore, a transfer device is supplied to allow for the transfer of the diluent into the product vial.

Composition

Ingredient	Amount	Function
Total protein	120 – 320 mg	------(b)(4)------
FXIII	1000 – 1600 IU	Active ingredient
Human albumin (b(4))	120 – 200 mg	------(b)(4)------
Glucose ----(b)(4)----- (b(4)/-----.)	80 – 120 mg	------(b)(4)------
Sodium chloride (b(4)/----	140 – 220 mg	------(b)(4)------
Sodium hydroxide (-b(4)-/------.)	Small amounts	pH adjustment
sWFI	20 mL	Diluent for reconstitution

The reconstitution diluent for FXIII Concentrate (Human) is sWFI, complying with the USP monograph "sWFI".

2. *Pharmaceutical development*

1) ----------

---------- (b)(4)----------
The physico-chemical and biological properties of the final product FXIII Concentrate are summarized as follows:

Physico-chemical properties

Parameter	**Specification**
Albumin	6 - 10 mg/mL
Appearance	Colorless to slightly yellowish, slightly opalescent
Dissolution time	----(b)(4)-----
Glucose	4 - 6 mg/mL
----(b)(4)----- protein	----(b)(4)-----
----(b)(4)----- protein	----(b)(4)-----
pH value	----(b)(4)-----
Protein	6 - 16 mg/mL

CSLB did revalidation of lyophilizer -(b)(4)--, which is designated for manufacture of Fibrogammin P for the US-market. During the revalidation, the sponsor had performed extensive sampling and analytical testing of final product vials in the production of Fibrogammin P -----b(4)----------No deviations occurred.

Comment: The validation results met the pre-defined criteria, which support the manufacturing process of FXIII FDP.

4. Control of excipients

Human albumin (b)(4), Glucose and Sodium chloride serve as excipients in FXIII Concentrate. They all comply with the requirements of --------(b)(4)----------.

----------(b)(4)----------. Human albumin ----------(b)(4)---------- . The product is licensed in the US under the trade name of --(b)(4)--.

----------(b)(4)----------.

Overview of addition of excipients during the process

Excipients	**Production step**
Human Albumin ((b)(4))	-------(b)(4)-----
Glucose -----(b)(4)--- (--------(b)(4))	-------(b)(4)-----
Sodium chloride (------ (b)(4))	-------(b)(4)-----
	-------(b)(4)-----
	-------(b)(4)-----
	-------(b)(4)-----
	-------(b)(4)-----
	----------(b)(4)----------
	-------(b)(4)-----
Sodium hydroxide (--b(4)-----)	-------(b)(4)-----
	-------(b)(4)-----

1) Validation of Analytical procedures

Apart from the tests performed by the manufacturer of the respective excipients, the analytical procedures/testing instructions performed by CSLB for each excipient are listed in the table below.

Analytical procedures for testing of excipients

Excipient	**Parameter**	**Testing instruction**
Sodium chloride	------(b)(4)-----	------(b)(4)-----
	------(b)(4)-----	----------(b)(4)----------
	------(b)(4)-----	---------- ------(b)(4)----------
	------(b)(4)-----	------(b)(4)-----
	------(b)(4)-----	------(b)(4)-----
Sodium hydroxide	------(b)(4)-----	------(b)(4)-----
		------(b)(4)-----
Glucose -----(b)(4)-----	------(b)(4)-----	---------- ----------(b)(4)----------
	------(b)(4)-----	------(b)(4)-----
	------(b)(4)-----	---------- --------(b)(4)----------
	------(b)(4)-----	----------(b)(4)----------
	------(b)(4)-----	---------- -----(b)(4)----------

Excipient	Parameter	Testing instruction
	------(b)(4)-----	------(b)(4)-----
	------(b)(4)-----	------(b)(4)-----
Human albumin (b)(4)	------(b)(4)-----	----------(b)(4)----------

These analytical methods have been validated, and the pre-defined criteria of all parameters are fully met. Therefore, the validation data support these analytical methods used for testing of the respective excipients.

2) Excipients of human or animal origin

FXIII Concentrate is manufactured with the US licensed human albumin -------(b)(4)---------- which complies with 21 CFR 640 and the (b)(4).

Excipient of biological origin with compendial requirement

Material	Compendial requirement	Process step	Function
Human albumin ------ ------(b)(4)-----	(b)(4); complies with requirements in 21 CFR 640.80 to 640.86	---------- ----(b)(4)-----	--(b)(4)---

No excipients of animal origin are used in FXIII Concentrate (Human).

3) Novel excipients

None of the excipients in the FXIII DP is a novel excipient.

5. Control of drug product

1) Specification and justification for final product testing

Product quality attribute		Specification	Testing method	Justification
Practicability and organoleptic properties	Dissolution time	---(b)(4)---	Dissolution of the solid and visual control	Manufacturing experience

5) Characterization of impurities

Relevant information concerning the impurity profile of the product is included in Report IR-642-015. CSLB has identified the protein impurities in the FDP, ----b(4)--- -- -- -- -- -- -- -- -- -- -- -- -- -- --------------------------------

6. Container closure system

The FXIII Concentrate (Human) container closure system consists of an injection vial and a rubber stopper sealed with a combination crimp cap. The vial containing the lyophilized DP is packed in carton boxes. Each carton box contains one vial and one diluent vial.

List of container/closures used for FXIII Concentrate

Presentation	Container	Stopper	Crimp caps
1250 U	Injection vial 30 mL, -b(4)- glass	------(b)(4)---- rubber	**-(b)(4)-** cap, aluminum/polypropylene dead gold/red

Details on the containers and closures of the diluent are included in CSL's Drug Master File "sWFI" (--b(4)-------), referring to the vial data of the (b)(4) filling size.

---b(4)----------------------- has been validated through -----(b)(4)---- ------ -------------- -----(b)(4)---- test.

1) Vial

The single-dose injection glass vial with a nominal size of 30 mL for FXIII Concentrate (Human) meets the requirements for -(b)(4)-glass that is suitable for most

acidic and neutral, aqueous preparations including products for parenteral administration in accordance with Section ----*b(4)*----------

-------*b(4)*---------- ----------
---*b(4)*----- ----------

2) Stopper

The vial is closed with ----------(b)(4)---------- rubber stopper (----------
----------(b)(4)----) that comply with ---(b)(4) ----------
and is free of latex.

3) Crimp cap

The stopper is secured by combination cap consisting of an aluminum crimp cap with a concentric hole and an integrated polypropylene plastic disc (flip-off). The crimp cap meets international standards for dimensional criteria.

Comment: Please provide the method validation reports on container closure ----------(b)(4)---------- ---------.

7. Stability

1) Lots tested

There are 3 conformance lots in the stability study, which are listed as follows:

------(b)(4)----	------(b)(4)----	------(b)(4)----	------(b)(4)----
------(b)(4)----	------(b)(4)----	------(b)(4)----	------(b)(4)----

5) ----------(b)(4)----------

Based on the available data for Fibrogammin P ----b(4)---------- and ----b(4)----------rubber stopper, CSLB is proposing that the shelf-life of Fibrogammin P is 24 months when stored at 2 - 8°C. Within this period, this product may be stored at 25°C, not to exceed a cumulative storage period of 6 months.

---------b(4)----------

Comment: The available stability data indicate that no critical trends are detected during the observed long-term storage period. It supports the proposed shelf-life of FXIII Concentrate (Human). Regarding the reconstitution, please refer the comments on labeling.

In Container Closure System section, CSLB stated the vials used for FXIII Concentrate (Human) are 30-mL injection vials, glass --(b)(4) -. However, the vials described in the stability report STR-642-013-02-US are 30-mL injection vial --(b)(4)- . Please confirm the type of vials used for FXIII Concentrate (Human) in US market. Please clarify if it is compatible with regard to ----------(b)(4)---- 30-mL injection vials.

FACILITIES AND EQUIPMENT

Production and quality control of FXIII Concentrate (Human) is performed by CSLB in Marburg, Germany. The facilities used for the manufacture of FXIII Concentrate (Human) are listed in the following table.

FXIII Concentrate (Human) manufacturing facilities

---(b)(4)--	------(b)(4)----	------(b)(4)----
--(b)(4)--	----------(b)(4)----------	---------- ----(b)(4)---------- ---------
	----------(b)(4)----------	
	----------(b)(4)----------	
	----------(b)(4)----------	
--(b)(4)--	----------(b)(4)----------	----------(b)(4)---------- ----------
	----------(b)(4)---------- ----------	
	----------(b)(4)----------	
--(b)(4)--	----------(b)(4)----------	
	----------(b)(4)----------	
--(b)(4)--	----------(b)(4)----------	----------(b)(4)---------- ---------- ----------

The facilities are designed and constructed to provide appropriate material-, product- and personnel flows for the various products produced in the facilities. Manufacturing areas and procedures utilized in the manufacturing of FXIII Concentrate (Human) are designed to maintain segregation and to prevent cross-contamination of product by appropriate clean room design.

Comment: I defer to the comments on this section to our colleagues from DMPQ.

ADVENTITIOUS AGENTS SAFETY EVALUATION

1. *Virus safety*

The starting material human plasma is controlled at the single donation level by a rigorous process of selecting plasma centers, plasma donors and donations. In addition the plasma pool for fractionation is tested for ----b(4)----------
---

---
titers of human parvovirus B19 (B19V). Other ingredients or auxiliary substances added during the manufacturing process are also controlled and specified.

Production processes are performed according to GMP regulations and include process steps to reduce or remove microbes, prions, and viruses. The production processes are controlled by specified process control parameters and monitored by in-process control concerning microbes. Production processes have been investigated and validated concerning their effect to reduce microbes, prions, and viruses.

Removal of prions potentially present in the plasma pool by selected steps of the manufacturing process has been shown based on ----------(b)(4)---------- studies employing ----------(b)(4)----------.

----------(b)(4)----------
The results are summarized as follows:

Mean prion reduction factors of FXIII Concentrate (Human)

----------(b)(4)----------	----------**(b)(4)**---------	
	(b)(4)	**(b)(4)**
----------(b)(4)----------	**(b)(4)**	**(b)(4)**
----------(b)(4)----------	**(b)(4)**	**(b)(4)**
----------(b)(4)--------	**(b)(4)**	**(b)(4)**
----------(b)(4)----------	**(b)(4)**	**(b)(4)**

----------(b)(4)----------

Concerning the viruses reduction capacity of the manufacturing procedure --(b)(4)-- were tested in validated, ---------(b)(4)---------- for their capacity to inactivate and/or remove the test viruses. Virus inactivation and/or removal by the individual stages of the manufacturing process were tested at ----------(b)(4)---------- using HIV-1, bovine viral diarrhea virus (BVDV – a model virus for HCV), herpes simplex virus type 1 (HSV-1 – an unspecific model virus), HAV, and canine parvovirus (CPV – a model virus for resistant non-enveloped viruses). Also, the virus inactivation capacity of the pasteurization step was studied for West Nile virus (WNV) and B19V. The resulting virus reduction factors are summarized in the following table.

Cumulative rates (log_{10}) for inactivation/elimination of various viruses achieved by the manufacturing procedure of FXIII Concentrate (Human)

Manufacturing step	**Virus reduction factor (log_{10})**					
	Enveloped viruses				Non-enveloped viruses	
	HIV	BVDV	WNV	HSV-1	HAV	CPV
$Al(OH)_3$ Adsorption/Vitacel and defibrination	≥ 5.8	2.8	Not done	≥ 7.6	1.3	(0.4)[a]
Ion exchange chromatography	5.0	3.4	Not done	Not done	3.4	3.7
Pasteurization	≥ 5.8	≥ 8.1	≥ 7.4	≥ 7.6	4.3	1.0[b]
Cumulative virus reduction (log_{10})	≥ 16.6	≥ 14.3	≥ 7.4	≥ 15.2	9.0	4.7

BVDV: bovine viral diarrhea virus; WNV: West Nile virus; HSV-1: herpes simplex virus type 1; CPV: canine parvovirus; a: not included in the calculation of the cumulative virus reduction factor; b: Studies using human parvovirus B19, which are considered experimental in nature, have demonstrated a virus reduction factor of ≥4.0 log_{10} by Pasteurization.

The only biological material added to Fibrogammin P is human albumin, which is added ----------(b)(4)----------. This human albumin (b)(4) is manufactured by ----(b)(4)-- and is licensed in US under the trade name ----------(b)(4)---------- for further safety information).

2. Virus inactivation/elimination on equipment

Besides the assurance provided with the virus inactivation/elimination in the manufacturing processes, further assurance that any virus potentially retained in the production system would be adequately destroyed prior to re-use of the system is provided by sanitization of equipment. ----------(b)(4)---------- as shown in the following table.

Removal/inactivation of pathogens by ----(b)(4)----

Pathogen	**Reduction factor [log_{10}] // time [h]**
Viruses	
HIV	**(b)(4)**
BVDV	**(b)(4)**
HHV-1 (HSV-1)	**(b)(4)**
PRV	**(b)(4)**
HPV-1 (poliovirus type 1)	**(b)(4)**
HAV	**(b)(4)**
BPV	**(b)(4)**
CPV	**(b)(4)**
Prions (----(b)(4)----------)	
(b)(4)	**(b)(4)**
(b)(4)	**(b)(4)**
(b)(4)	**(b)(4)**

Comment: The manufacturing processes for production of FXIII Concentrate (Human) are validated for the capability in virus inactivation and/or removal. The data support current manufacturing process which is used for virus clearance.

LABELING

Please revise the description on "16.2 Storage and Handling" in the package insert, which areas are highlighted as below:

> When storage in a refrigerator at 2 – 8°C (36 – 46°F), **[Trade Name] is stable for the period indicated by the expiration date on the carton and vial labels. Within the expiration date, [Trade Name] may be stored at room temperature not to exceed 25°C (77°F) for up to 6 months. Do not return the product to the refrigerator after it is stored at room temperature. Clearly mark the date of room temperature storage on the carton label.** Do not use beyond the expiration date on the carton and vial labels**, or end of**

the period for room temperature storage, whichever comes first. Store vial in the original carton in order to protect **it** from light. Do not freeze.

This product does not contain a preservative and should be administered promptly after reconstitution. The product must be used within 4 hours after reconstitution.

Accordingly, please revise the carton and vial label to include the relevant changes recommended by the FDA. Please provide a space on the carton for marking the date when the product is stored at room temperature.

Recommendation

Please convey the following information request to CSL Behring and request their responses to be submitted to the FDA by 13 December 2010:

1. Please include data on -----(b)(4)-- in microbiological testing of -------(b)(4)-------, which we had requested during the review of the IND.

2. Regarding the specification for residual moisture, please provide the results to one decimal place (e.g., -(b)(4)-), or the validated limit of quantitation of the analytical method (e.g., ≤ 0.1 %).

3. Please provide the report for the validation of the Factor XIII (FXIII) -----(b)(4)----------.

4. Please provide the reports for the validation of methods to assess container closure integrity, ------(b)(4)----------.

5. In the Container Closure System section, you stated that the vials used for FXIII Concentrate (Human) are 30-mL injection vials, glass -(b)(4)-. However, the vials described in the stability report STR-642-013-02-US are 30-mL injection vial, glass --(b)(4)---.

    A. Please clarify the type of glass vials used for FXIII Concentrate (Human) in the US market.
    B. If different types of glass vials are used, please describe the differences between the -----(b)(4)--- injection vials, and demonstrate their compatibility with the product.

6. Please revise the description in Section 16.2 *Storage and Handling* in the package insert as follows:

    When storage in the refrigerator at 2 – 8°C (36 – 46°F), [Trade Name] is stable for the period indicated by the expiration date on the carton and vial

labels. Within the expiration date, [Trade Name] may be stored at room temperature not to exceed 25°C (77°F) for up to 6 months. Do not return the product to the refrigerator after it is stored at room temperature. Clearly mark the date of room temperature storage on the carton label. Do not use beyond the expiration date on the carton and vial labels, or end of the period for room temperature storage, whichever comes first. Store vial in the original carton in order to protect it from light. Do not freeze.

This product does not contain a preservative and should be administered promptly after reconstitution. The product must be used within 4 hours after reconstitution.

Please revise the carton and vial labels accordingly to include the changes recommended by the FDA. Please provide a space on the carton label for marking the date when the product is stored at room temperature.
