I. INTRODUCTION (1)²

This guidance defines the recommended format and content of a Periodic Benefit-Risk Evaluation Report (PBRER), and provides an outline of points to be considered in the preparation and submission of the PBRER. The PBRER described in this guidance is intended to be a common standard for periodic benefit-risk evaluation reporting on marketed products (including approved drugs that are under further study) among the ICH regions.

This guidance revises, combines, and replaces two ICH guidances: *E2C Clinical Safety Data Management: Periodic Safety Update Reports for Marketed Drugs* (ICH E2C guidance) and *Addendum to E2C Clinical Safety Data Management: Periodic Safety Update Reports for Marketed Drugs* (ICH E2C addendum).³

In general, FDA’s guidance documents do not establish legally enforceable responsibilities. Instead, guidances describe the Agency’s current thinking on a topic and should be viewed only as recommendations, unless specific regulatory or statutory requirements are cited. The use of the word *should* in Agency guidances means that something is suggested or recommended, but not required.

---

¹ This guidance was developed within the Efficacy Implementation Working Group of the International Conference on Harmonisation of Technical Requirements for Registration of Pharmaceuticals for Human Use (ICH) and has been subject to consultation by the regulatory parties, in accordance with the ICH process. This document has been endorsed by the ICH Steering Committee at Step 4 of the ICH process, November 2012. At Step 4 of the process, the final draft is recommended for adoption to the regulatory bodies of the European Union, Japan, and the United States.

² Arabic numbers reflect the organizational breakdown of the document endorsed by the ICH Steering Committee at Step 4 of the ICH process, November 2012.

³ We update guidances periodically. To make sure you have the most recent version of a guidance, check the Drugs guidance Web page at [http://www.fda.gov/Drugs/GuidanceComplianceRegulatoryInformation/Guidances/default.htm](http://www.fda.gov/Drugs/GuidanceComplianceRegulatoryInformation/Guidances/default.htm) or the Vaccines, Blood and Biologics Web page at [http://www.fda.gov/Drugs/GuidanceComplianceRegulatoryInformation/Guidances/default.htm](http://www.fda.gov/Drugs/GuidanceComplianceRegulatoryInformation/Guidances/default.htm)
A. Background (1.1)

When a new medicinal product is approved for marketing, demonstration of safety and efficacy are generally based on data from a limited number of patients, many studied under the controlled conditions of randomized trials. Often, higher risk subgroups and patients with concomitant illnesses that require use of other drugs are excluded from clinical trials, and long-term treatment data are limited. Moreover, patients in trials are closely monitored for evidence of adverse events. In clinical practice, monitoring is less intensive, a broader range of patients are treated (age, comorbidities, drugs, genetic abnormalities), and events too rare to occur in clinical trials might be observed (e.g., severe liver injury). These factors underlie the significance of continuing analysis of relevant safety, efficacy, and effectiveness information throughout the life cycle of a medicinal product — promptly (as important findings occur) and periodically — to allow an overall assessment of the accumulating data.

Although the majority of new information will be safety-related, new information about effectiveness, limitations of use, alternative treatments, and many other aspects of the drug’s place in therapy may be pertinent to its benefit-risk assessment.

The ICH E2C guidance reached Step 4 of the ICH process in 1996, and was intended to harmonize the periodic reporting requirements of regulatory authorities and to provide, in a common format, the worldwide interval safety experience of a medicinal product at defined times post-approval. At that time, the focus of the Periodic Safety Update Report (PSUR) was on relevant new safety information in the context of patient exposure, to determine whether changes were called for in the reference safety information (RSI) to optimize the continued safe use of the product. In 2003, ICH incorporated the ICH E2C addendum with the ICH E2C guidance to provide important clarification, guidance, and flexibility.

Since that time, the pharmacovigilance environment has evolved, prompting reassessment of the role of the PSUR in the spectrum of safety documents submitted to regulatory authorities. This reassessment highlighted several factors that led to consensus for revision and refocus of the guidance to enhance its usefulness in light of advances in the field:

- Significant progress in the technology and science of pharmacovigilance, including electronic submission of individual case safety reports (ICSRs) to regulatory authorities, automated data mining techniques, and more attention to benefit-risk evaluation
- Greater emphasis on proactive and documented risk management planning
- Increasing recognition that meaningful evaluation of important new risk information should be undertaken in the context of a medicinal product’s benefits
- Overlap in the content of ICH Guidelines related to pharmacovigilance documentation

As noted above, the primary objective of the PSUR was to provide a comprehensive picture of the safety of approved medicinal products. With recognition that the assessment of the risk of a medicinal product is most meaningful when considered in light of its benefits, the

---

4 The terms *efficacy* and *effectiveness* are not standardized and have different meanings across some regions (see section II.F (2.6) of this guidance).

5 Definitions of many technical terms used in this guidance are included in a Glossary (Appendix A). The first mention of a term in the guidance is identified with an asterisk (*), and the term appears in bold type.
The proposed report would provide greater emphasis on benefit than the PSUR, particularly when risk estimates change importantly. In such cases, there should be an overall explicit evaluation of benefit-risk. Consequently, the name of the proposed report is the “Periodic Benefit-Risk Evaluation Report” (PBRER). The PBRER would also provide greater emphasis on the cumulative knowledge regarding a medicinal product, while retaining a focus on new information.

A formal evaluation of benefit is a new feature of the PBRER; however, it is recognized that a concise discussion of benefit will usually be sufficient, unless the safety or benefit-risk profile has changed significantly during the reporting interval. Thus, the level of detail provided in certain sections of the PBRER (e.g., evaluation of safety and efficacy data, evaluation of safety signals, and benefit-risk evaluation) should be proportional to the medicinal product’s known or emerging important risks and to evidence of emerging important benefits.

As the scope of the PBRER has been extended to include benefit as well as safety, the reference information for the report also should take this new factor into account. It is generally impractical for marketing authorization holders (MAHs) to have one reference information source that:

- Encompasses all parameters that contribute towards the benefit-risk evaluation (i.e., benefit, efficacy/effectiveness, indication(s) and safety information)
- Is common to all ICH regions
- Addresses all circumstances (e.g., generics, products licensed in one country only)

Therefore, this guidance proposes more practical options that MAHs can consider in selecting the most appropriate reference product information for the PBRER. These proposals incorporate the original ICH E2C concept of reference safety information (e.g., Company Core Safety Information* (CCSI)), with the addition of the approved indications for the product. This reference product information can be the Company Core Data Sheet* (CCDS) or another document proposed by the MAH (see section II.D (2.4)).

The important baseline efficacy and effectiveness information summarized in section 17.1 of the PBRER will form the basis (or reference) for the benefit evaluation, irrespective of the reference product information used by the MAH.

The frequency of submission of reports to regulatory authorities is subject to national or regional regulatory requirements, and may differ, depending on many factors. The guidance includes advice on managing different frequencies of PBRER submission in different regions.

One of the motivating factors behind incorporating the ICH E2C addendum with the ICH E2C guidance was the desire to enhance efficiency by decreasing the duplication of effort in preparing various regulatory documents. This guidance has been developed, therefore, such that corresponding sections of the PBRER, development safety update report (DSUR) (ICH E2F guidance), and safety specification of a risk management plan (ICH E2E guidance) can be identical in content (see also section I.D (1.4), Relation of the PBRER to Other ICH Documents). This guidance reached step 4 in November 2012.
B. Objectives (1.2)

The main objective of a PBRER is to present a comprehensive, concise, and critical analysis of new or emerging information on the risks of the medicinal product, and on its benefit in approved indications, to enable an appraisal of the product’s overall benefit-risk profile. The PBRER should contain an evaluation of new information relevant to the medicinal product that has become available to the MAH during the reporting interval, in the context of cumulative information by:

- Summarizing relevant new safety information that could have an impact on the benefit-risk profile of the medicinal product
- Summarizing any important new efficacy/effectiveness information that has become available during the reporting interval
- Examining whether the information obtained by the MAH during the reporting interval is in accord with previous knowledge of the medicinal product’s benefit and risk profile
- Where important new safety information has emerged, conducting an integrated benefit-risk evaluation for approved indications

When appropriate, the PBRER should include proposed action(s) to optimize the benefit-risk profile.

Urgent safety information should be reported through the appropriate mechanism; the PBRER is not intended to be used to provide initial notification of significant new safety information or to provide the means by which new safety concerns are detected.

C. Scope of the PBRER (1.3)

The main focus of each PBRER is the evaluation of relevant new safety information from the available data sources, placed within the context of any pertinent efficacy/effectiveness information that may have become available since the international birth date (IBD) (the date of the first marketing approval in any country in the world) or the development international birth date (DIBD) (the date of first authorization for the conduct of an interventional clinical trial in any country). All pertinent new safety and efficacy/effectiveness information discovered during the reporting interval should be discussed in the appropriate sections of the PBRER.

For the purposes of this guidance, sources of available information refer to data regarding the active substance(s) included in the medicinal product or the medicinal product that the MAH may reasonably be expected to have access to, and data that are relevant to the evaluation of

---

6 For the purpose of this document, the terms authorization and authorized refer to clinical trials, and the terms approval and approved refer to marketing applications.

7 This guidance should not serve to limit the scope of information to be provided in the evaluation of benefit-risk of a medicinal product. Please refer to the applicable laws and regulations in the countries and regions in which the PBRER is to be submitted.
the safety or benefit-risk profile (see also Appendix E, Examples of Possible Sources of Information That May Be Used in the Preparation of the PBRER). For example, there may be less information available to the MAH regarding a generic product as compared to a product for which the MAH is the innovator, and only a published report may be accessible for a clinical trial not sponsored by the MAH. On the other hand, for a MAH-sponsored clinical trial, the MAH will have access to patient-level data towards evaluation of the product’s benefit-risk. When desired by the MAH, a list of the sources of information used to prepare the PBRER can be provided as an appendix to the report.

The PBRER should include cumulative knowledge of the product while retaining focus on new information (i.e., the overall safety evaluation and integrated benefit-risk evaluation will take into account cumulative information). Because clinical development of a drug frequently continues following marketing approval, relevant information from postmarketing studies or clinical trials in unapproved indications or populations should also be included in the PBRER. Similarly, because knowledge of the safety of a medicinal product can be derived from evaluation of data associated with uses other than the approved indication(s), such knowledge should be reflected in the risk evaluation, where relevant and appropriate.

D. Relation of the PBRER to Other ICH Documents (1.4)

At present, some ICH countries and regions accept submission of separate types of periodic reports to fulfill national and regional requirements within the post-approval period: the PSUR (ICH E2C guidance and E2C addendum) for periodic reporting of the safety of approved medicinal products, the DSUR (ICH E2F guidance) for periodic reporting on the safety of medicinal products that remain in clinical development, and the safety specification component of the ICH E2E guidance that might be submitted at the time of marketing application and/or PSUR submission to aid in the planning of pharmacovigilance activities. Because these documents have different regulatory purposes, different periodicities, and can be reviewed by different divisions within a single regulatory authority, each document should be complete in its own right — a comprehensive document that can stand alone. Nevertheless, overlap and inconsistencies between the content of the DSUR, PSUR, and safety specification can lead to inefficiencies in the production of the documents by the MAH.

Modular Approach

This guidance aims to facilitate flexibility by encouraging the use of individual sections that are common to more than one report — modules that can be used for different regulatory authorities and for different purposes. Therefore, the PBRER has been developed in such a way that the content of several sections can be used for sections of other documents as a basis for a modular approach. For example, if the DIBD of a DSUR for a medicinal product is aligned to the IBD of the PBRER for the same product as suggested in ICH E2F, the content of a number of sections of the DSUR can also be used in the PBRER when the data lock points (DLPs) are the same (i.e., when each report covers an interval of 1 year based on the IBD).

Appendix D of this guidance lists the PBRER sections that can be shared with either the DSUR (ICH E2F guidance) or safety specification of a risk management plan (ICH E2E guidance), if appropriate.
The use of common sections across the PBRER, DSUR, and safety specification as a modular approach has a number of advantages:

- Maximizes the utility of the modules across multiple regulatory documents.
- Promotes consistency across the PBRER, DSUR and Safety Specification.
- Avoids unnecessary duplication of effort.
- Is expected to improve efficiency for MAHs in preparing these documents.
- Facilitates flexible utilization of existing sections (modules) when, for example, the PBRER covers different time intervals or should be submitted at different times to multiple different authorities. In these circumstances, only modules that include new information or new evaluation should be updated when submitting the PBRER.

Although currently out of scope for the ICH E2C(R2) guidance, it is envisioned that the modular approach proposed, based on common sections across various documents, will ultimately facilitate development of electronic modules for use in future regulatory submissions.

II. GENERAL PRINCIPLES (2)

A. Single PBRER for an Active Substance (2.1)

The PBRER should provide information on all approved indications, dosage forms, and regimens for the active substance, with a single DLP. In some circumstances, it will be appropriate to present data by indication, dosage form, dosing regimen, or population (e.g., children versus adults) within the relevant section(s) of the PBRER. In exceptional cases, submission of separate PBRERs might be appropriate, for example, an active substance used in two formulations for systemic and topical administration in entirely different indications. In these cases, the regulatory authorities should be notified and their agreement obtained, preferably at the time of approval.

B. PBRERs for Fixed-Dose Combination Product (2.2)

For combinations of substances also marketed individually, information for the fixed combination can be reported either in a separate PBRER or included as separate presentations in the report for one of the individual substances, depending on the circumstances. Listing related PBRERs is considered important.

C. Products Manufactured and/or Marketed by More Than One Company (2.3)

Each MAH is responsible for submitting PBRERs for its own products.
When companies are involved in contractual relationships (e.g., licensor-licensee), respective responsibilities for preparation and submission of the PBRER to the regulatory authorities should be clearly specified in the written agreement.

When data received from a partner company or companies might contribute meaningfully to the safety, benefit, and/or benefit-risk analyses and influence the reporting company’s product information, these data should be included and discussed in the PBRER.

D. Reference Information (2.4)

An objective of a PBRER is to evaluate whether information obtained during the reporting interval is in accord with previous knowledge on the product’s benefit and risk profile, and to indicate whether changes should be made to the reference product information. Having one reference source of information that can be applied across the three ICH regions would facilitate a practical, efficient, and consistent approach to the benefit-risk evaluation and make the PBRER a unique report accepted in all countries and regions.

The reference product information for the PBRER would include core safety and approved indications components. To facilitate the assessment of benefit and benefit-risk by indication in the evaluation sections of the PBRER, the reference product information document should list all approved indications in ICH countries or regions. It is likely that these indications will also apply in other countries or regions. However, when the PBRER is also to be submitted to other countries in which there are additional locally approved indications, these indications can either be added to the reference product information or handled as regional appendix/appendices as considered most appropriate by the MAH. The basis for the benefit evaluation should be the baseline important efficacy/effectiveness information summarized in section 17.1 of the PBRER.

The following possible options can be considered by MAHs in selecting the most appropriate reference product information for a PBRER:

- Company Core Data Sheet (CCDS)

In accordance with the ICH E2C guidance and E2C addendum recommendations, it is a common practice for MAHs to prepare their own CCDS, which includes sections relating to safety, indications, dosing, pharmacology, and other information concerning the medicinal product. The core safety information contained within the CCDS is referred to as the CCSI. A practical option is for MAHs to use the latest CCDS in effect at the end of the reporting interval as the reference product information for both the risk sections of the PBRER as well as the main approved indications for which benefit is evaluated.

When the CCDS for a medicinal product does not contain information on approved indications, the MAH should clearly specify which document is used as the reference information for the approved indications in the PBRER.

- Other options for the reference product information

When there is no CCDS or CCSI for a product (e.g., where the product is approved in only one country or region, or for established/generic products on the market for many years), the MAH should clearly specify the reference information being used. This might comprise
national or regional product information such as the U.S. Package Insert (USPI) or European Summary of Product Characteristics (SmPC), or the Japanese package insert, as appropriate. The basis for the benefit evaluation should be the baseline important efficacy/effectiveness information summarized in section 17.1 of the PBRER.

Where the reference information for approved indications is a separate document to the RSI, the version current at the DLP of the PBRER should be included in Appendix 1.

The MAH should continuously evaluate whether any revision of the reference product information/RSI should be made whenever new safety information is obtained throughout the reporting interval. Significant changes to the reference product information/RSI made during the interval should be described in section 4 of the PBRER (Changes to Reference Safety Information) and include:

- Changes to contraindications, warnings/precautions sections of the RSI
- Addition of adverse drug reactions (ADR(s)) and interactions
- Addition of important new information on use in overdose
- Removal of an indication or other restrictions for safety or lack of efficacy reasons

Significant changes to the RSI made after the DLP but before submission of the PBRER should be included in section 14 of the report (Late Breaking Information), if feasible.

If stipulated by applicable regional requirements, the MAH should provide, in a regional appendix, information on any final, ongoing, or proposed changes to the national or local authorized product information.

E. Level of Detail Within PBRER (2.5)

The level of detail provided in certain sections of the PBRER should depend on the medicinal product’s known or emerging important benefits and risks. This approach is applicable to those sections of the PBRER in which there is evaluation of safety data, efficacy/effectiveness data, safety signals, and benefit-risk. Therefore, the extent of information provided in such PBRER sections will vary among individual PBRERs.

For example, when there is important new safety information, a detailed presentation of that information should be included, plus the relevant benefit information, to facilitate a robust benefit-risk analysis. Conversely, when little new important safety information has become available during the reporting interval, a concise summary of baseline benefit information should be sufficient, and the benefit-risk evaluation would consist primarily of an evaluation of updated interval safety data.

F. Efficacy/Effectiveness (2.6)

For the purpose of this guidance, evidence on benefits in clinical trials and in everyday medical practice should be reported. Because the terms are not harmonized across regions, the terms efficacy/effectiveness are used in this guidance to clarify that information from both clinical trials and everyday medical practice are within the scope of the information on benefit that should be included within the PBRER. In some regions, efficacy refers to evidence of benefit from controlled clinical trials while effectiveness implies use in everyday medical practice. Conversely, in other regions, this distinction is not made.
G. Benefit-Risk Evaluation (2.7)

When a drug is approved for marketing, a conclusion has been reached that, when used in accordance with approved product information, its benefits outweigh its risks. As new information about the drug emerges during marketing experience, benefit-risk evaluation should be carried out to determine whether benefits continue to outweigh risks, and to consider whether steps should be taken to improve the benefit-risk balance through risk minimization activities (e.g., labeling changes, communications with prescribers, or other steps).

H. Periodicity and PBRER Data Lock Point (2.8)

1. International Birth Date and Data Lock Point (2.8.1)

Each medicinal product should have an IBD — the IBD is the date of the first marketing approval for any product containing the active substance granted to any company in any country in the world. When a report contains information on different dosage forms, formulations, or uses (indications, routes and/or populations), the date of the first marketing approval for any of the various authorizations should be regarded as the IBD and, therefore, determines the DLP for purposes of the PBRER. The DLP is the date designated as the cut-off for data to be included in a PBRER. Through PBRERs prepared with harmonized DLPs based on a common IBD, the same updated safety and benefit-risk information can be reviewed globally by different regulatory authorities.

When a separate PBRER is prepared for a fixed-dose combination product (see section II.B (2.2)), the DLP for that PBRER can be based on either the earliest IBD of one of the component active substances, or the IBD of the first marketing approval anywhere in the world for the fixed-dose combination.

When clinical development of a medicinal product continues following marketing approval, if desired by the sponsor/MAH, the beginning of the DSUR reporting interval can be synchronized with the IBD-based cycle so that both the DSUR and PBRER can be prepared at the same time, using the same DLP. This approach will facilitate use of the proposed common sections/modules for both the PBRER and DSUR when both are submitted annually (see Appendix D).

2. Managing Different Frequencies of PBRER Submission (2.8.2)

The need for the submission of a PBRER and the frequency of report submission to regulatory authorities are subject to national or regional regulatory requirements, and usually depend on such factors as approval dates, the length of time the product has been on the market, and the extent of knowledge of the benefit-risk profile of the product. The PBRER format and content are intended to apply to periodic reports that cover reporting periods of 6 months or longer. Once a drug has been marketed for several years, national or regional regulation can allow the frequency of submission to be extended to longer time intervals (e.g., greater than 1 year for products considered to have an established and acceptable profile or considered to be low risk); however, more frequent PBRERs might be continued in other regions. As a result, MAHs might encounter the following scenarios:
PBRERs can be on 6-month, annual, and less-frequent submission timetables simultaneously across different regions.

Changes in reporting frequency might also apply after important additions or changes in clinical use are approved (e.g., new indication(s) and/or new population(s)). In these circumstances, it is possible that the reporting interval will be shortened, even for older products with a previously reduced frequency of PBRER submission.

An ad hoc PBRER might be requested by a regulatory authority (see section II.H.2.a (2.8.2.1) of this guidance).

Independent of the length of the interval covered by the report:

Each PBRER should be stand-alone and reflect new and cumulative information currently available to the MAH.

Regulators will normally accept use of the IBD to determine the DLP for PBRERs. Where national or regional requirements differ from this, the MAH may wish to discuss with the relevant regulatory authority. Use of a single harmonized IBD and DLP for each product is important to reduce the burden of work involved in preparing PBRERs, and respects the original purpose of the PBRER — to prepare a single worldwide summary on a product that can be submitted to different regulatory authorities.

For newly approved products, a 6-month periodicity applies in many regions, for at least the first 2 years after approval.

For PBRERs submitted on a routine/regular basis, the reports should be based on cumulative data, with interval data sets of 6 months, or multiples of 6 months.

Sections that provide interval information should be reviewed for updating for each PBRER, and the content used in the previous PBRER can be reviewed and reused for sections where no new information has arisen since preparation of the last PBRER, if appropriate. Following review, it may be determined that sections providing evaluation of cumulative data may not need to be updated if the content remains up to date with current information (see Figure 1).

In situations when an MAH is preparing PBRERs on both a 6-month and an annual basis for different regulatory authorities, the regulatory authority receiving a PBRER on a 6-month cycle might accept PBRERs containing 12-month interval data (see Figure 2). MAHs should discuss this approach with the relevant regulatory authority or authorities.
**Figure 1: Submission of PBRERs Based on the Same Data Lock Point, with Various Reporting Periods.**

Shading indicates period of interval data.
For all reports, the cumulative data reflect all data from the IBD/DIBD. **

**Cumulative Clinical Trial Summary Tabulation of Serious Adverse Events & Clinical Trial Exposure data only**

**Figure 2: Submission of 6-Month and Annual PBRERs**

Region 1 requests 6-month PBRER, and receives PBRER A, B, C, and D (assuming agreement has been reached with pertinent regulatory authority or authorities).
Region 2 requests annual PBRER, and receives PBRER B and D.
Ad hoc PBRERs are reports outside the routine reporting requirements, and might be requested by some regulatory authorities. Where an ad hoc report is requested and a PBRER has not been prepared for a number of years, it is likely that a completely new report should be prepared by the MAH.

3. **Time Interval Between Data Lock Point and the Submission (2.8.3)**

As a result of the expanded scope of the PBRER, the time interval between the DLP and submission of PBRERs should be as follows:

- PBRERs covering intervals of 6 or 12 months: within 70 calendar days
- PBRERs covering intervals in excess of 12 months: within 90 calendar days
- Ad hoc PBRERs: 90 calendar days, unless otherwise specified in the ad hoc request

The day of DLP is day 0 of the 70- or 90-calendar-day interval between the DLP and report submission. Where national or regional requirements differ from the above, the MAH should discuss the timeline for submission with the relevant regulatory authority.

**I. Format and Presentation of PBRER (2.9)**

1. **Format (2.9.1)**

The recommended format and content of the PBRER, including table of contents, section numbering, and content of each section, is outlined below.

The full ICH E2C(R2) guidance format should be used for all PBRERs. When no relevant information is available or a PBRER section is not applicable, this should be stated. Particular sections of the PBRER might share content with other regulatory reports (e.g., documents described in ICH E2E and E2F guidances). It may be possible for the MAHs to take advantage of the modular approach of the PBRER (i.e., sections that can be separated and submitted independently or combined with other documents) to facilitate such regulatory needs, maximize the utility of the content, and reduce duplicate work.

2. **Presentation (2.9.2)**

The recommended table of contents, including section numbering, for the PBRER is provided below:

- Title Page
- Executive Summary
- Table of Contents
  1. Introduction
  2. Worldwide Marketing Approval Status
  3. Actions Taken in the Reporting Interval for Safety Reasons
  4. Changes to Reference Safety Information
5. Estimated Exposure and Use Patterns
   5.1 Cumulative Subject Exposure in Clinical Trials
   5.2 Cumulative and Interval Patient Exposure from Marketing Experience
6. Data in Summary Tabulations
   6.1 Reference Information
   6.2 Cumulative Summary Tabulations of Serious Adverse Events from Clinical Trials
   6.3 Cumulative and Interval Summary Tabulations from Postmarketing Data Sources
7. Summaries of Significant Findings from Clinical Trials during the Reporting Period
   7.1 Completed Clinical Trials
   7.2 Ongoing Clinical Trials
   7.3 Long-Term Follow-up
   7.4 Other Therapeutic Use of Medicinal Product
   7.5 New Safety Data Related to Fixed Combination Therapies
8. Findings From Non-Interventional Studies
9. Information From Other Clinical Trials and Sources
   9.1 Other Clinical Trials
   9.2 Medication Errors
10. Nonclinical Data
11. Literature
12. Other Periodic Reports
13. Lack of Efficacy in Controlled Clinical Trials
14. Late-Breaking Information
15. Overview of Signals: New, Ongoing, or Closed
16. Signal and Risk Evaluation
   16.1 Summary of Safety Concerns
   16.2 Signal Evaluation
   16.3 Evaluation of Risks and New Information
   16.4 Characterization of Risks
   16.5 Effectiveness of Risk Minimization (if applicable)
17. Benefit Evaluation
   17.1 Important Baseline Efficacy/Effectiveness Information
   17.2 Newly Identified Information on Efficacy/Effectiveness
   17.3 Characterization of Benefits
18. Integrated Benefit-Risk Analysis for Approved Indications
III. GUIDANCE ON CONTENTS OF THE PBRER (3)

All sections should be completed, and when no information is available, this should be stated. Note that section III.N (3.14) of this guidance provides guidance on the content of section N (14) of the PBRER. For example, “Reference Information,” described in section III.F.1 (3.6.1) of this guidance corresponds to section 6.1 of the PBRER.

Title Page

The title page of the PBRER should include the following information:

- Date of the report
- Medicinal product(s)
- IBD
- Reporting interval
- MAH(s) name(s) and address(es)
- Any statement on the confidentiality of the information included in the PBRER

Executive Summary

This section should provide a concise summary of the most important information contained in the report.

The following information should be included in the Executive Summary:

- Introduction
- Reporting interval
- Medicinal product(s) – mode(s) of action, therapeutic class(es), indication(s), dose(s), route(s) of administration, formulation(s)
- Estimated cumulative exposure of clinical trial subjects; interval and cumulative post-approval exposure
- Number of countries in which the medicinal product is approved
- Summary of overall benefit-risk evaluation (based on section 18.2 of the PBRER)
- Actions taken or proposed for safety reasons (e.g., significant changes to the reference product information, other risk minimization activities)
Contains Nonbinding Recommendations

Table of Contents

A. Introduction (3.1)

Section 1 of the PBRER should include the following information:

- IBD
- Reporting interval
- Medicinal product(s) — mode(s) of action, therapeutic class(es), dose(s), route(s) of administration, formulation(s)
- A brief description of the approved indication(s) and population(s)
- A brief description and explanation of any information that has not been included in the PBRER
- The rationale for submission of multiple PBRERs for the medicinal product, if applicable

B. Worldwide Marketing Approval Status (3.2)

Section 2 of the PBRER should provide a brief narrative overview, including date of first approval, indication(s), approved dose(s), and where approved, if applicable.

C. Actions Taken in the Reporting Interval for Safety Reasons (3.3)

Section 3 of the PBRER should include a description of significant actions related to safety that have been taken during the reporting interval, related to either investigational uses or marketing experience by the MAH, sponsor of a clinical trial(s), regulatory authorities, data monitoring committees, or ethics committees that had:

- A significant influence on the benefit-risk profile of the approved medicinal product, and/or
- An impact on the conduct of a specific clinical trial(s) or on the overall clinical development program.

The reason(s) for each action should be provided, if known, and additional relevant information should be provided when appropriate. Relevant updates to previous actions should also be summarized in this section. Examples of significant actions taken for safety reasons include:

Actions related to investigational drugs:

- Refusal to authorize a clinical trial for ethical or safety reasons
Contains Nonbinding Recommendations

- Partial\(^8\) or complete clinical trial suspension or early termination of an ongoing clinical trial\(^9\) because of safety findings or lack of efficacy

- Recall of investigational drug or comparator

- Failure to obtain marketing approval for a tested indication, including voluntary withdrawal of a marketing application

- Risk management activities, including:
  - Protocol modifications because of safety or efficacy concerns (e.g., dosage changes, changes in study inclusion/exclusion criteria, intensification of subject monitoring, limitation in trial duration)
  - Restrictions in study population or indications
  - Changes to the informed consent document relating to safety concerns
  - Formulation changes
  - Addition by regulators of a special safety-related reporting requirement
  - Issuance of a communication to investigators or healthcare professionals
  - Plans for new studies to address safety concerns

Actions related to marketed drugs:

- Failure to obtain or apply for a marketing approval renewal

- Withdrawal or suspension of a marketing approval

- Suspension of supply by the MAH

- Risk management activities, including:
  - Significant restrictions on distribution or introduction of other risk minimization measures
  - Significant safety-related changes in labeling documents that could affect the development program, including restrictions on use or population treated
  - Communications to healthcare professionals
  - New postmarketing study requirement(s) imposed by regulator(s)

\(^8\) Partial suspension might include several actions (e.g., suspension of repeat-dose studies, but continuation of single-dose studies; suspension of trials in one indication, but continuation in another; and/or suspension of a particular dosing regimen in a trial, but continuation of other doses).
D. Changes to Reference Safety Information (3.4)

Section 4 of the PBRER should list any significant changes to the reference safety information within the reporting interval. Such changes might include information relating to contraindications, warnings, precautions, ADRs, overdose, and interactions; important findings from ongoing and completed clinical trials* and significant non-clinical findings (e.g., carcinogenicity studies). Specific information relevant to these changes should be provided in the appropriate sections of the PBRER.

A clean version of the reference document that is current at the DLP of the PBRER should be included in Appendix 1. A track change version of the reference information is not required.

E. Estimated Exposure and Use Patterns (3.5)

Sections 5.1 and 5.2 of the PBRER should provide estimates of the size and nature of the population exposed to the medicinal product. Section 5.1 of the PBRER should provide information on cumulative exposure in clinical trials. Section 5.2 should provide cumulative and interval exposure in the marketed setting. Brief descriptions of the method(s) used to estimate the subject/patient exposure should be provided, as well as the limitations of the methods. Consistent methods for calculating patient exposure should be used across PBRERs for the same product. If a change in the method is appropriate, both methods and calculations should be provided in the PBRER introducing the change.

1. Cumulative Subject Exposure in Clinical Trials (3.5.1)

Section 5.1 of the PBRER should include the following information, if applicable, presented in tabular format (see Appendix B, Tables 1, 2, and 3, for examples):

- Cumulative numbers of subjects from ongoing and completed clinical trials exposed to the investigational medicinal product, placebo, and/or active comparator(s) since the DIBD. It is recognized that for older products, precise data might not be available.

- More detailed information on cumulative subject exposure in clinical trials should be presented, if available (e.g., subgrouped by age, sex, and racial/ethnic group) for the entire development program.

- Important differences among trials in dose, routes of administration, or patient populations can be noted in the tables, if applicable, or separate tables can be considered.

- If clinical trials have been or are being performed in special populations (e.g., pregnant women; patients with renal, hepatic, or cardiac impairment; or patients with relevant genetic polymorphisms), exposure data should be provided, as appropriate.

- When there are substantial differences in duration of exposure between subjects randomized to the investigational medicinal product or comparator(s), or disparities in duration of exposure between clinical trials, it can be useful to express exposure in subject-time (subject-days, -months, or -years).

- Investigational drug exposure in healthy volunteers might be less relevant to the overall safety profile, depending on the type of adverse reaction, particularly when subjects are
exposed to a single dose. Such data can be presented separately with an explanation, as appropriate.

- If the serious adverse events (SAEs) from clinical trials are presented by indication in the summary tabulations, the patient exposure should also be presented by indication, where available.

- For individual trials of particular importance, demographic characteristics should be provided separately.

2. Cumulative and Interval Patient Exposure From Marketing Experience (3.5.2)

Separate estimations should be provided for interval exposure (since the DLP of the previous PBRER) and, when possible, cumulative exposure (since the IBD). See Appendix B, Tables 4 and 5, for examples. The estimated number of patients exposed should be provided when possible, along with the method(s) used to determine the estimate. If an estimate of the number of patients is not available, alternative estimated measures of exposure should be presented along with the method(s) used to derive them, if available. Examples of alternative measures of exposure include patient-days of exposure and number of prescriptions. Measures of drug sales, such as tonnage or dosage units, can be used only if it is not possible to provide the measures described above. The concept of a defined daily dose can also be used to estimate patient exposure.

The data should be presented according to the following categories:

a. Post-approval (nonclinical trial) exposure:

An overall estimation of patient exposure should be provided.

In addition, the data should be routinely presented by indication, sex, age, dose, formulation, and region, where applicable.

Depending upon the product, other variables may be relevant, such as number of vaccination courses, route(s) of administration, and duration of treatment.

When there are patterns of reports indicating a safety signal, exposure data within relevant subgroups should be presented, if possible.

b. Post-approval use in special populations:

Where post-approval use has occurred in special populations, available information regarding cumulative patient numbers exposed and the method of calculation should be provided. Sources of such data include non-interventional studies designed to obtain this information, including registries. Populations to be considered for discussion include, but might not be limited to:

- Pediatric population
- Elderly population
- Pregnant or lactating women
- Patients with hepatic and/or renal impairment
Contains Nonbinding Recommendations

- Patients with other relevant co-morbidity
- Patients with disease severity different from that studied in clinical trials
- Sub-populations carrying relevant genetic polymorphism(s)
- Patients of different racial and/or ethnic origins

c. Other post-approval use:

If the MAH becomes aware of patterns of use of the medicinal product considered relevant for the interpretation of safety data, the PBRER should provide a brief description of them. Examples of such patterns of use can include overdose, drug abuse, misuse, and use beyond that recommended in the reference product information (e.g., an anti-epileptic drug used for neuropathic pain and/or prophylaxis of migraine headaches). Such patterns can be regional. If known, the MAH can briefly comment on whether use beyond that recommended in the reference product information is supported by clinical guidelines, clinical trial evidence, or an absence of approved alternative treatments. Quantitative use information should be provided, if available. For purposes of identifying patterns of use outside the terms of the reference product information, the MAH should use the appropriate sections of the reference product information that was in effect at the DLP of the PBRER (e.g., approved indication, contraindications).

F. Data in Summary Tabulations (3.6)

PBRER sections 6.1 to 6.3 should present cumulative summary tabulations of SAEs from clinical trials and postmarketing sources that have been reported to the MAH since the DIBD. At the discretion of the MAH, graphical displays can be used to illustrate specific aspects of the data when useful to enhance understanding.

1. Reference Information (3.6.1)

Section 6.1 of the PBRER should specify the version(s) of the coding dictionary used for analyses of adverse reactions.

2. Cumulative Summary Tabulations of Serious Adverse Events From Clinical Trials (3.6.2)

Section 6.2 of the PBRER should provide background for the appendix that provides a cumulative summary tabulation of SAEs reported in the MAH’s clinical trials, from the DIBD to the DLP of the current PBRER. The MAH should explain any omission of data (e.g., clinical trial data might not be available for products marketed for many years). The tabulation(s) should be organized by system organ class (SOC), for the investigational drug, as well as for the comparator arm(s) (active comparators, placebo) used in the clinical development program. Data can be integrated across the program. Alternatively, when useful and feasible, tabulations of SAEs can be presented by trial, indication, route of administration, or other variables. This section should not serve to provide analyses or conclusions based on the SAEs.

Appendix B, Table 6, of this guidance provides an example of summary tabulations of SAEs from clinical trials. The following points should be considered:
In general, the tabulation(s) of SAEs from clinical trials should include only those terms that were used in defining the case as serious; they should not include nonserious events.

When the Medical Dictionary for Regulatory Activities (MedDRA) terminology is used for coding the adverse event/reaction terms, the Preferred Term level and SOC should be presented in the summary tabulations.

The tabulations should include blinded and unblinded clinical trial data. Unblinded SAEs might originate from completed trials and individual cases that have been unblinded for safety-related reasons (e.g., expedited reporting), if applicable. Sponsors/MAHs should not unblind data for the specific purpose of preparing the PBRER.

Certain adverse events in clinical trials can be excluded from the clinical trials summary tabulations, but such exclusions should be explained in the report. For example, adverse events that have been defined in the protocol as “exempt” from special collection and entry into the safety database because they are anticipated in the patient population, and those that represent study endpoints, can be excluded (e.g., deaths reported in a trial of a drug for congestive heart failure where all-cause mortality is the primary efficacy endpoint, disease progression in cancer trials).

Causality assessment is generally useful for the evaluation of individual rare ADRs. Individual case causality assessment has less value in the analysis of aggregate data, where group comparisons of rates are possible. Therefore, the summary tabulations should include all SAEs for the investigational drug, active controls, and placebo. It may be useful to give rates by dose.

3. Cumulative and Interval Summary Tabulations from Post-Marketing Data Sources (3.6.3)

Section 6.3 of the PBRER should provide background for the appendix that provides cumulative and interval summary tabulations of adverse reactions, from the IBD to the DLP of the current PBRER. As described in the ICH E2D guidance, for marketed medicinal products, spontaneously reported* adverse events usually imply at least a suspicion of causality by the reporter, and should be considered to be adverse reactions for regulatory reporting purposes. The tabulation should include:

- Serious and nonserious adverse drug reactions from spontaneous ICSRs, including reports from healthcare professionals, consumers, scientific literature, and regulatory authorities
- Serious adverse reactions from non-interventional studies
- Solicited reports* of serious adverse reactions

The tabulation should include interval and cumulative data presented side-by-side (see Appendix B, Table 7), and should be organized by SOC.

For special issues or concerns, additional tabulations of adverse reactions can be presented by indication, route of administration, or other variables. This section should not serve to provide analyses or conclusions based on the data presented.
G. Summaries of Significant Safety Findings From Clinical Trials During the Reporting Interval (3.7)

Section 7 of the PBRER should provide a brief summary of clinically important emerging efficacy/effectiveness and safety findings obtained from the MAH’s sponsored clinical trials that have become available during the reporting interval of the report. The safety signals arising from clinical trial sources should be tabulated in section 15 of the PBRER. Evaluation of the signals (whether or not categorized as refuted signals or either potential risks* or identified risks*) that were closed during the reporting interval should be presented in Section 16.2 of the PBRER. New information in relation to any previously known potential or identified risks and not considered to constitute a newly identified signal should be evaluated and characterized in sections 16.3 and 16.4, respectively. Findings from clinical trials not sponsored by the MAH should be described in the relevant sections of the PBRER.

When relevant to the benefit-risk evaluation, information on lack of efficacy from clinical trials for treatments of non-life-threatening diseases in approved indications should also be summarized in this section. Information on lack of efficacy from clinical trials with products intended to treat or prevent serious or life-threatening illnesses should be summarized in section 13 of the PBRER.

When possible and relevant, data categorized by sex and age (particularly children versus adult), indication, dose, and region should be presented.

A listing of any MAH-sponsored postmarketing interventional trials with the primary aim of identifying, characterizing, or quantifying a safety hazard, or confirming the safety profile of the medicinal product that were completed or ongoing during the reporting interval should be included in an appendix. The listing should include the following information for each trial:

- Study identification (e.g., protocol number or other identifier)
- Study title (abbreviated study title, if applicable)
- Study type (e.g., randomized clinical trial, cohort study, case-control study)
- Population studied (including country and other relevant population descriptors, e.g., pediatric population or trial subjects with impaired renal function)
- Study start (as defined by the MAH) and projected completion dates
- Status:
  - Ongoing (clinical trial has begun)
  - Completed (clinical study report is finalized);

1. Completed Clinical Trials (3.7.1)

Section 7.1 of the PBRER should provide a brief summary of clinically important emerging efficacy and safety findings obtained from clinical trials completed during the reporting
interval. This information can be presented in narrative format or as a synopsis. It could include information that supports or refutes previously identified safety concerns, as well as evidence of new safety signals.

2. **Ongoing Clinical Trials (3.7.2)**

If the MAH is aware of clinically important information that has arisen from ongoing clinical trials (e.g., learned through interim safety analyses or as a result of unblinding of subjects with adverse events), section 7.2 should briefly summarize the concern(s). It could include information that supports or refutes previously identified safety concerns, as well as evidence of new safety signals.

3. **Long-Term Follow-Up (3.7.3)**

Where applicable, section 7.3 should provide information from long-term follow-up of subjects from clinical trials of investigational drugs, particularly advanced therapy products.

4. **Other Therapeutic Use of Medicinal Product (3.7.4)**

Section 7.4 of the PBRER should include clinically important safety information from other programs conducted by the MAH that follow a specific protocol, with solicited reporting as per the ICH E2D guidance (e.g., expanded access programs, compassionate use programs, particular patient use, single-patient investigational new drug applications (INDs), treatment INDs, and other organized data collection).

5. **New Safety Data Related to Fixed Combination Therapies (3.7.5)**

Unless otherwise specified by national or regional regulatory requirements, the following options can be used to present data from combination therapies:

- If the product that is the subject of a PBRER is also approved or under development as a component of a fixed combination product or a multidrug regimen, this section should summarize important safety findings from use of the combination therapy.
- If this PBRER is for a fixed combination product, this section should summarize important safety information arising from the individual components.

The information specific to the combination can be incorporated into a separate section(s) of the PBRER for one or all of the individual components of the combination.

H. **Findings From Non-Interventional Studies (3.8)**

Section 8 should summarize relevant safety information or information having potential impact on the benefit or risk evaluations, from MAH-sponsored, non-interventional studies that have become available during the reporting interval (e.g., observational studies, epidemiological studies, registries, and active surveillance programs). This should include relevant information from drug use studies when applicable to multiple regions.

---

9 Examples of synopses are provided in the ICH E3 guidance and by the Council for International Organizations of Medical Sciences (CIOMS) VII.
A listing of any MAH-sponsored, postmarketing non-interventional study or studies with the primary aim of identifying, characterizing, or quantifying a safety hazard; confirming the safety profile of the medicinal product; or measuring the effectiveness of risk management measures that were completed or ongoing during the reporting interval should be included in an appendix (see section III.G (3.7) of this guidance for the information that should be included in the listing).

Final study reports completed during the reporting interval for the studies mentioned in the paragraph above should also be included in the regional appendix of the report where stipulated by regional requirements.

1. **Information From Other Clinical Trials and Sources (3.9)**

   1. **Other Clinical Trials (3.9.1)**

Section 9.1 of the PBRER should summarize information accessible to the MAH with reasonable and appropriate effort from any other clinical trial/study sources, including results from pooled analyses or meta-analyses of randomized clinical trials, and safety information provided by co-development partners or from investigator-initiated trials.

   2. **Medication Errors (3.9.2)**

Section 9.2 should summarize relevant information on patterns of medication errors and potential medication errors, even when not associated with adverse outcomes. A potential medication error is the recognition of circumstances that could lead to a medication error, and might or might not involve a patient. Such information could be relevant to the interpretation of safety data or the overall benefit-risk evaluation of the medicinal product. A medication error can arise at any stage in the medication use process, and can involve patients, consumers, or healthcare professionals.

This information can be received by the MAH via spontaneous reporting systems, medical information queries, customer complaints, screening of digital media, patient support programs, or other available information sources.

Signals or risks identified from any information source and/or category of reports should be presented and evaluated in the relevant section of the PBRER.

J. **Nonclinical Data (3.10)**

Section 10 of the PBRER should summarize major safety findings from nonclinical in vivo and in vitro studies (e.g., carcinogenicity, reproduction, or immunotoxicity studies) ongoing or completed during the reporting interval. Results from studies designed to address specific safety concerns should be included in the PBRER, regardless of the outcome. Implications of the findings presented in PBRER section 10 should be discussed in the relevant evaluation sections of the report.

K. **Literature (3.11)**
Section 11 should summarize new and significant safety findings, either published in the peer-reviewed scientific literature or made available as unpublished manuscripts, relevant to the approved medicinal product that the MAH has become aware of during the reporting interval. Literature searches for PBRERs should be wider than those for individual adverse reaction cases, and include studies reporting safety outcomes in groups of subjects. If relevant, information on active substances of the same class should be considered.

L. Other Periodic Reports (3.12)

Unless otherwise specified by national or regional regulatory requirements, the MAH should prepare a single PBRER for a single active substance. However, if an MAH prepares multiple PBRERs for a single active substance (e.g., covering different indications, or formulations), section 12 should summarize significant findings from the other periodic reports if they are not presented elsewhere within this report.

When available, based on contractual agreements, the MAH should summarize significant findings from periodic reports provided during the reporting interval by other parties (e.g., sponsors, MAHs, other contractual partners).

M. Lack of Efficacy in Controlled Clinical Trials (3.13)

Data from clinical trials indicating lack of efficacy, or lack of efficacy relative to established therapy or therapies for products intended to treat or prevent serious or life-threatening illnesses (e.g., excess cardiovascular adverse events in a trial of a new anti-platelet drug for acute coronary syndromes) could reflect a significant risk to the treated population and should be summarized in section 13.

N. Late-Breaking Information (3.14)

Section 14 of the PBRER should summarize information on potentially important safety and efficacy/effectiveness findings that arise after the DLP but while the PBRER is in preparation. Examples include clinically significant new publications; important follow-up data; clinically relevant toxicological findings; and any action that the MAH, a data monitoring committee, or a regulatory authority has taken for safety reasons. New individual case reports should not be included unless they are considered to constitute an important index case (i.e., the first instance of an important event), an important safety signal, or where they may add information to the evaluation of safety concerns already presented in the PBRER (e.g., a well-documented and unconfounded case report of aplastic anemia in a medicinal product known to be associated with adverse effects on the bone marrow).

Any significant change proposed to the reference product information that has occurred after the DLP of the report but before submission should also be included in this section, where feasible. Such changes could include a new contraindication, warning/precaution, or new adverse drug reaction.

The data presented in this section should also be taken into account in the evaluation of risks and new information (see section III.P.3 (3.16.3) of this guidance).

O. Overview of Signals: New, Ongoing, or Closed (3.15)
The general location for presentation of information on signals and risks within the PBRER is shown in Appendix F of this guidance. Section 15 of the PBRER should provide a high-level overview of safety signals that were closed (i.e., the evaluation was completed) during the reporting interval as well as ongoing signals* that were undergoing evaluation, at the end of reporting interval. For the purposes of the PBRER, a signal should be included once it has undergone the initial screening or clarification step, and a determination made to conduct further evaluation by the MAH. It should be noted that a safety signal is not synonymous with a statistic of disproportionate reporting for a specific drug/event combination because a validation step is called for. Signals can be qualitative (e.g., a pivotal individual safety case report, case series) or quantitative (e.g., a disproportionality score, findings of a clinical trial or epidemiological study). Signals can arise in the form of an information request or inquiry on a safety issue from a regulatory authority.

Decisions regarding the subsequent classification of these signals and the conclusions of the evaluation involve medical judgment and scientific interpretation of available data, which is presented in section 16 of the PBRER.

A new signal is a signal that the MAH has become aware of during the reporting interval. New clinically important information on a previously closed signal* that has become available during the reporting period of the PBRER (i.e., a new aspect of a previously refuted signal or recognized risk likely to warrant further action to verify) would also constitute a new signal. New signals can be classified as closed or ongoing, depending on the status of signal evaluation at the DLP of the PBRER. Examples would include new information on a previously:

- Closed and refuted signal, which would result in the signal being reopened

- Identified risk that is indicative of a clinically significant difference in the severity of the risk (e.g., transient liver enzyme increases are identified risks, and new information is received indicative of a more severe outcome such as hepatic failure; neutropenia is an identified risk and a well-documented and unconfounded case report of agranulocytosis is received)

- Identified risk for which a higher frequency of the risk is newly found (e.g., in a subpopulation)

- Potential risk* that, if confirmed, would warrant a new warning, precaution, new contraindication or restriction in indication(s) or population, or other risk minimization activities

Within this section or as an appendix, a tabular listing of all signals, ongoing or closed, at the DLP of the PBRER should be included. This table should include the following information (see Appendix C for an example).

- A brief description of the signal
- Date when the MAH became aware of the signal
- Status of the signal (closed or ongoing at the DLP)
- Date when the signal was closed, if applicable
- Source of the signal
Contains Nonbinding Recommendations

- A brief summary of key data
- Plans for further evaluation
- Actions taken or planned

Detailed signal evaluations for closed signals should not be included in this section, but instead should be presented in section 16.2 (Signal Evaluation) of the PBRER. Evaluation of new information in relation to any previously known identified and potential risks and not considered to constitute a newly identified signal* should be provided in section 16.3 (Evaluation of Risks and New Information) of the PBRER.

When a regulatory authority has requested that a specific topic (not considered a signal) be monitored and reported in a PBRER, the MAH should summarize the result of the analysis in PBRER section 15 if it is negative. If the specific topic becomes a signal, it should instead be included in the signal tabulation and discussed in PBRER section 16.2.

P. Signal and Risk Evaluation (3.16)

Section 16 of the PBRER should provide:

- A succinct summary of what is known about important identified and potential risks and important missing information* at the beginning of the reporting interval covered by the report (16.1)
- An evaluation of all signals closed during the reporting interval (16.2)
- An evaluation of new information with respect to previously recognized identified and potential risks (16.3)
- An updated characterization of important potential and identified risks, where applicable (16.4)
- A summary of the effectiveness of risk minimization activities in any country or region that might have utility in other countries or regions (16.5)

Appendix F of this guidance provides a flowchart to illustrate the mapping of signals and risks to specific sections of the PBRER.

The evaluation subsections should not summarize or repeat information presented in previous sections of the PBRER, but should instead provide an interpretation of the information, with a view towards characterizing the profile of those risks assessed as important. As a general rule, it is not necessary to include individual case narratives in the evaluation sections of the PBRER; however, when integral to the scientific analysis of a signal or risk, a clinical evaluation of pivotal or illustrative cases (e.g., the first case of suspected agranulocytosis with an active substance belonging to a class known to be associated with this adverse reaction) should be provided.

1. Summary of Safety Concerns (3.16.1)

Section 16.1 should provide a summary of safety concerns at the beginning of the reporting interval, against which new information and evaluations can be made. These comprise:
Contains Nonbinding Recommendations

- Important identified risks*
- Important potential risks*
- Important missing information

The following factors should be considered when determining whether or not a risk is important:

- Medical seriousness of the risk, including the impact on individual patients
- Its frequency, predictability, preventability, and reversibility
- Potential impact on public health (frequency; size of treated population)
- Potential for avoidance of a medical product with a preventive benefit as a result of public perception of risk

For products with an existing safety specification, this section can be either the same as, or be derived from, the safety specification summary (according to the ICH E2E guidance) at the start of the reporting interval of the current PBRER. For products without an existing safety specification, this section should provide information on the important identified and potential risks and important missing information associated with use of the product, based on pre-approval and post-approval experience. Important identified and potential risks may include, for example:

- Important adverse reactions
- Interactions with other medicinal products
- Interactions with foods and other substances
- Medication errors
- Effects of occupational exposure
- Pharmacological class effects

The summary on important missing information should take into account whether there are critical gaps in knowledge for specific safety issues or populations that use the medicinal product.

2. Signal Evaluation (3.16.2)

Section 16.2 of the PBRER should summarize the results of evaluations of all safety signals (whether or not classified as important) that were closed during the reporting interval. A safety signal can be closed either because it is refuted or because it is determined to be a potential or identified risk following evaluation. Therefore, the two main categories that should be included in this section are:

1. Those signals that, following evaluation, have been refuted as false signals based on medical judgment and a scientific evaluation of the currently available information

2. Those signals that, following evaluation, have been categorized as either a potential or identified risk, including lack of efficacy
For both categories of closed signals, a concise description of each signal evaluation should be included to provide to the regulatory authorities the basis upon which the signal was either refuted or considered to be a potential or identified risk by the MAH.

It is recommended that the level of detail provided in the description of the signal evaluation be proportionate to the medical significance of the signal, its public health importance, and the extent of the available evidence. When multiple evaluations are included under both categories of closed signals, they can be presented in the following order:

- Closed and refuted signals
- Closed signals that are categorized as important potential risks
- Closed signals that are categorized as important identified risks
- Closed signals that are potential risks not categorized as important
- Closed signals that are identified risks not categorized as important

Where applicable, the closed signal evaluations can be presented by indication or population.

The description(s) of the signal evaluations can be included in this section of the PBRER, or in an appendix. Each signal evaluation should include the following information, as appropriate:

- Source of the signal
- Background relevant to the evaluation
- Method(s) of evaluation, including data sources, search criteria (where applicable, the specific MedDRA terms (e.g., PTs, HLTs, SOCs) or Standardized MedDRA Queries (SMQs) that were reviewed), and analytical approaches
- Results — a summary and critical analysis of the data considered in the signal evaluation; where integral to the assessment, this may include a description of a case series or an ICSR (e.g., an index case of well-documented agranulocytosis or Stevens Johnson syndrome)
- Discussion
- Conclusion

3. Evaluation of Risks and New Information (3.16.3)

Section 16.3 should provide a critical appraisal of new information relevant to previously recognized risks that is not already included in section 16.2 of the PBRER, Signal Evaluation.

New information that constitutes a signal with respect to a previously recognized risk or previously refuted signal should be presented in the tabular summary in Appendix C and evaluated in section 16.2 of the PBRER, if the signal is also closed during the interval of the PBRER.
Updated information on a previously recognized risk that does not constitute a signal should be included in this section. Examples include information that confirms a potential risk as an identified risk, or information that allows further characterization of a previously recognized risk.

New information can be organized as follows:

1. New information on important potential risks
2. New information on important identified risks
3. New information on other potential risks not categorized as important
4. New information on other identified risks not categorized as important
5. Update on important missing information

The focus of the evaluation(s) is on new information that has emerged during the reporting interval of the PBRER. This should be concise and interpret the impact, if any, on the understanding and characterization of the risk. Where applicable, the evaluation will form the basis for an updated characterization of important potential and identified risks in section 16.4 of the report. It is recommended that the level of detail of the evaluation included in this section be proportional to the available evidence on the risk and its medical significance and public health relevance.

The evaluation(s) of new information and missing information update(s) can be included in this section of the PBRER, or in an appendix. Each evaluation should include the following information, as appropriate:

- Source of the new information
- Background relevant to the evaluation
- Method(s) of evaluation, including data sources, search criteria, and analytical approaches
- Results — a summary and critical analysis of the data considered in the risk evaluation
- Discussion
- Conclusion including whether or not the evaluation supports an update of the characterization of any of the important potential and identified risks in section 16.4 of the PBRER

Any new information on populations exposed or data generated to address previously missing information should be critically assessed in this section. Unresolved concerns and uncertainties should be acknowledged.

4. Characterization of Risks (3.16.4)

Section 16.4 of the PBRER should characterize important identified and important potential risks based on cumulative data (i.e., not restricted to the reporting interval), and describe important missing information.
Depending on the nature of the data source, the characterization of risk can include, where applicable:

- Frequency
- Numbers of cases (numerator); precision of estimate, taking into account the source of the data
- Extent of use (denominator) (expressed in, e.g., numbers of patients, patient-time) and precision of estimate
- Estimate of relative risk; precision of estimate
- Estimate of absolute risk; precision of estimate
- Impact on the individual patient (effects on symptoms, quality or quantity of life)
- Public health impact
- Patient characteristics relevant to risk (e.g., age, pregnancy/lactation, disease severity, hepatic/renal impairment, relevant comorbidity, genetic polymorphism)
- Dose, route of administration
- Duration of treatment, risk period
- Preventability (i.e., predictability, ability to monitor for a “sentinel” adverse reaction or laboratory marker)
- Reversibility
- Potential mechanism
- Strength of evidence and its uncertainties, including analysis of conflicting evidence, if applicable

When missing information could constitute an important risk, it should be included as a safety concern. The limitations of the safety database (in terms of, e.g., number of patients studied, cumulative exposure or long-term use) should be discussed.

For PBRERs for products with several indications, formulations, or routes of administration, where there might be significant differences in the identified and potential risks, it might be appropriate to present risks by indication, formulation, or route of administration. Headings that could be considered include:

- Risks relating to the active substance
- Risks related to a specific formulation or route of administration (including occupational exposure)
Contains Nonbinding Recommendations

- Risks relating to a specific population
- Risks associated with non-prescription use (for substances that are available as both prescription and non-prescription products)

5. Effectiveness of Risk Minimization (if applicable) (3.16.5)

Section 16.5 of the PBRER should summarize relevant information that has become available during the reporting interval concerning the effectiveness and/or limitations of specific risk minimization activities for important identified risks.

Insights into the effectiveness of risk minimization activities in any country or region that might have utility in other countries or regions are of particular interest. Information can be summarized by region, if applicable and relevant.

When reporting in a PBRER the results of evaluations that are relevant to only one region and that have become available during the reporting interval, the results should be provided in regional appendices.

Q. Benefit Evaluation (3.17)

PBRER sections 17.1 and 17.2 should provide the baseline (17.1) and newly identified (17.2) benefit information that support the characterization of benefit described in section 17.3 that in turn supports the benefit-risk evaluation in section 18.

1. Important Baseline Efficacy/Effectiveness Information (3.17.1)

Section 17.1 should summarize information on the efficacy/effectiveness of the medicinal product as of the beginning of the reporting interval, and should provide the basis for the benefit evaluation. This information should relate to the approved indication(s) of the medicinal product listed in the reference product information (see section II.D (2.4) of this guidance).

For medicinal products with multiple indications, populations, and/or routes of administration, the benefit should be characterized separately by these factors, where relevant.

The level of detail provided in this section should be sufficient to support the characterization of benefit in PBRER section 17.3 and the benefit-risk assessment in section 18.

2. Newly Identified Information on Efficacy/Effectiveness (3.17.2)

New information on efficacy/effectiveness in approved indications that may have become available during the reporting interval should be presented in PBRER section 17.2. For approved indications, new information on efficacy/effectiveness under conditions of actual use should also be described in this section, if available. New information about efficacy/effectiveness in uses other than the approved indication(s) should not be included, unless relevant for the benefit-risk evaluation in the approved indication. Information on indications approved during the reporting interval should also be included in this section.
Contains Nonbinding Recommendations

The level of detail provided in this section should be sufficient to support the characterization of benefit in section 17.3 and the benefit-risk assessment in section 18.

New information on efficacy/effectiveness might also include changes in the therapeutic environment that could have an impact on efficacy/effectiveness over time (e.g., vaccines, emergence of resistance to anti-infective agents).

3. Characterization of Benefits (3.17.3)

Section 17.3 of the PBRER should provide an integration of the baseline benefit information (see section III.Q.1 (3.17.1) of this guidance) and any relevant new benefit information (see section III.Q.2 (3.17.2)) that has become available during the reporting interval for approved indications.

This section should provide a concise but critical evaluation of the strengths and limitations of the evidence on efficacy/effectiveness, considering the following, when available:

- A brief description of the strength of evidence of benefit, considering comparator(s), effect size, statistical rigor, methodological strengths and deficiencies, and consistency of findings across trials/studies
- New information that challenges the validity of a surrogate endpoint, if used
- Clinical relevance of the effect size
- Generalizability of treatment response across the indicated patient population (e.g., information that demonstrates lack of treatment effect in a subpopulation)
- Adequacy of characterization of dose-response
- Duration of effect
- Comparative efficacy
- A determination of the extent to which efficacy findings from clinical trials are generalizable to patient populations treated in medical practice

The level of detail provided in PBRER section 17.3 should be sufficient to support the analysis of benefit-risk in section 18.

When there are no new relevant benefit data, section 17.3 should provide a characterization of the information in section 17.1 of the PBRER.

When there is new positive benefit information and no significant change in the risk profile in this reporting interval, the integration of baseline and new information in this section should be succinct.

R. Integrated Benefit-Risk Analysis for Approved Indications (3.18)
Whereas PBRER sections 16.4 and 17.3 present the risks and benefits, respectively, section 18 should provide an integration and critical analysis of the key information in these sections as described below. Section 18 provides the benefit-risk analysis, and should not simply duplicate the benefit and risk characterization presented in sections 16.4 and 17.3.

1. Benefit-Risk Context — Medical Need and Important Alternatives (3.18.1)

Section 18.1 should provide a brief description of the medical need for the medicinal product in the approved indications, and summarize alternatives (medical, surgical, or other, including no treatment).

2. Benefit-Risk Analysis Evaluation (3.18.2)

A benefit-risk profile is specific to an indication and population. For products approved for more than one indication, benefit-risk profiles should be evaluated and presented for each indication individually. If there are important differences in the benefit-risk profiles among populations within an indication, benefit-risk evaluation should be presented by population, if possible. The evaluation should be presented and discussed in a way that facilitates the comparison of benefits and risks, and should take into account the following points:

- Whereas previous sections should include all important benefit and risk information, not all benefits and risks contribute importantly to the overall benefit-risk evaluation. Therefore, the key benefits and risks considered in the evaluation should be specified. The key information presented in the previous benefit and risk sections should be carried forward for integration in the benefit-risk evaluation.

- The context of use of the medicinal product should be considered: the condition to be treated, prevented, or diagnosed; its severity and seriousness; and the population to be treated.

- With respect to a key benefit(s), the following factors should be considered: its nature, clinical importance, duration, and generalizability, as well as evidence of efficacy in nonresponders to other therapies and alternative treatments. The effect size should also be considered. If there are individual elements of benefit, all of them should be considered (e.g., for therapies for arthritis, reduction of symptoms and inhibition of radiographic progression of joint damage).

- With respect to risk, its clinical importance should be considered (e.g., nature of toxicity; seriousness; frequency; predictability; preventability; reversibility; impact on patients; and whether it arose from off-label use, a new use, or misuse).

- The strengths, weaknesses, and uncertainties of the evidence should be considered when formulating the benefit-risk evaluation. A description of how the uncertainties in the benefits and risks have an impact on the evaluation should be provided. Limitations of the assessment should be discussed.

A clear explanation of the methodology and reasoning used to develop the benefit-risk evaluation should be provided:

- The assumptions, considerations, and judgment or weighting that support the conclusions of the benefit-risk evaluation should be clear.
- If a formal quantitative or semi-quantitative assessment of benefit-risk is provided, a summary of the methods should be included.

Economic considerations (e.g., cost-effectiveness) should not be included in the benefit-risk evaluation.

When there is important new information or an ad hoc PBRER has been requested, a detailed benefit-risk analysis should be provided.

Conversely, where little new information has become available during the reporting interval, the primary focus of the benefit-risk evaluation might consist of an evaluation of updated interval safety data.

S. Conclusions and Actions (3.19)

Section 19 of the PBRER should provide a conclusion about the implications of any new information that has arisen during the reporting interval, in terms of the overall benefit-risk evaluation, for each approved indication, as well as for relevant subgroups, if appropriate.

Based on the evaluation of the cumulative safety data and the benefit-risk analysis, the MAH should assess the importance of further changes to the reference product information and propose changes, as appropriate.

In addition and as applicable, the conclusion should include preliminary proposal(s) to optimize or further evaluate the benefit-risk balance, for further discussion with the relevant regulatory authorities. This might include proposals for additional risk minimization activities.

These proposals should also be considered for incorporation into the risk management plan (e.g., the E2E pharmacovigilance plan and/or risk minimization plan, as appropriate).

If required by applicable regional laws and regulations, the MAH should provide, in a regional appendix, information on any final, ongoing, or proposed changes to the national or local authorized product information.

T. Appendices to the PBRER (3.20)

The PBRER should be accompanied by the following appendices, as appropriate, numbered as follows:

1. Reference Information

2. Cumulative Summary Tabulation of Serious Adverse Events From Clinical Trials and Interval/Cumulative Summary Tabulations From Marketed Experience

3. Tabular Summary of Safety Signals (if not included in the body of the report)

4. Listing of Intervventional and Non-Interventional Studies With a Primary Objective of Post-Authorization Safety Monitoring
5. List of the Sources of Information Used to Prepare the PBRER (when desired by the MAH)

The PBRER can also be accompanied by regional appendices, as appropriate, to fulfill national and regional requirements.
IV. APPENDICES TO THIS GUIDANCE (5)

APPENDIX A – Glossary

APPENDIX B – Examples of Summary Tabulations

APPENDIX C – Example of a Tabular Summary of Safety Signals That Were Ongoing or Closed During the Reporting Interval

APPENDIX D – List of PBRER Sections That Can Be Shared With Other Regulatory Documents

APPENDIX E – Examples of Possible Sources of Information That Can Be Used in the Preparation of the PBRER

APPENDIX F – Mapping of Signals and Risks to PBRER Sections
APPENDIX A – GLOSSARY

Whenever possible, the Working Group has used terms in use in other ICH guidances, or those previously proposed by the Council for International Organizations of Medical Sciences (CIOMS) working groups. Generally, the definitions of terms previously defined in ICH documents are not repeated in this glossary, except for those of particular importance to the PBRER.

| 13.  | Potential risk         | ICH E2F guidance     | An untoward occurrence for which there is some basis for suspicion of an association with the medicinal product of interest but where this association has not been confirmed. Examples of potential risks include the following:  
  - Nonclinical safety concerns that have not been observed or resolved in clinical studies  
  - Adverse events observed in clinical trials or epidemiological studies for which the magnitude of the difference, compared with the comparator group (placebo or active substance, or unexposed group), on the parameter of interest raises a suspicion of, but is not large enough to suggest, a causal relationship  
  - An event that is known to be associated with other products of the same class or that could be expected to occur based on the properties of the medicinal product |
<p>| 14.  | Reference safety       | ICH E2C(R2) guidance | All relevant safety information contained in the reference product information (e.g., CCDS) prepared by the MAH and that the MAH requests to be listed in all countries where the company markets the drug, except when the local regulatory authority specifically requests a modification. It is a subset of information contained within the MAH’s reference product information for the PBRER. Where the reference product information is the Company Core Data Sheet (CCDS), the reference safety information is the Company Core Safety Information (CCSI). |
| 15.  | Safety concern         | ICH E2C(R2) guidance | An important identified risk, important potential risk, or important missing information.                                                                                                                                 |
| 16.  | Signal                 | ICH E2C(R2) guidance | Information that arises from one or multiple sources (including observations and experiments), that suggests a new potentially causal association, or a new aspect of a known association, between an intervention and an event or set of related events, either adverse or beneficial, that is judged to be of sufficient likelihood to justify further action to verify. For section 16.2 of the PBRER, signals relate to adverse effects. |</p>

**Explanatory notes**

- **Signal term**
  A brief descriptive name of a medical concept for the signal. The description might evolve and be refined as the signal is evaluated. The concept and scope may, or may not, be limited to specific MedDRA term(s), depending on the source of signal.

- **Date detected (month/year)**
  Month and year the MAH became aware of the signal.

- **Status**
  **Ongoing:** Signal under evaluation at the DLP of the PBRER. Provide anticipated completion date, if known.
  **Closed:** Signal for which evaluation was completed before the DLP of the PBRER.
Contains Nonbinding Recommendations

Note: A new signal of which the MAH became aware during the reporting interval can be classified as closed or ongoing, depending on the status of signal evaluation at the DLP of the PBRER.

• **Date closed (month/year)**
  Month and year the signal evaluation was completed.

• **Source of signal**
  Data or information source from which a signal arose. Examples include, but might not be limited to, spontaneous adverse event reports, clinical trial data, scientific literature, nonclinical study results, or information requests or inquiries from a regulatory authority.

• **Reason for evaluation**
  A brief summary of key data and rationale for further evaluation.

• **Actions taken or planned**
  It should be stated whether or not a specific action has been taken or is planned for all closed signals that have been classified as potential or identified risks. If any further actions are planned for newly or previously identified signals under evaluation at the DLP, these should be listed. Otherwise leave blank for ongoing signals.

APPENDIX E – EXAMPLES OF POSSIBLE SOURCES OF INFORMATION THAT CAN BE USED IN THE PREPARATION OF THE PBRER

This list is not intended to be all inclusive; additional data sources can be used by the MAH to present safety and efficacy/effectiveness data in the PBRER and to evaluate the benefit-risk profile, as appropriate to the product and its known and important emerging benefits and risks (see also Introduction, subsection I.C (1.3) of this guidance, Scope of the PBRER, regarding sources of available information).

Examples of sources of information potentially relevant to the evaluation of benefits and risks that, if relevant, should be used in the preparation of the PBRER, include but are not limited to the following:

- Nonclinical studies
- Clinical trials, including research in unapproved indications or populations
- Spontaneous reports (for example, on the MAH’s safety database)
- MAH-sponsored Web sites (for additional information, see the ICH E2D guidance *Post-Approval Safety Data Management: Definitions and Standards for Expedited Reporting*)
- Observational studies such as registries
- Product usage data and drug use information
- Published scientific literature or reports from abstracts, including information presented at scientific meetings
- Unpublished manuscripts
- Active surveillance systems (for example, sentinel sites)
- Systematic reviews and meta-analyses
- Information arising from licensing partners, other sponsors, or academic institutions/research networks
- Patient support programs
- Investigations of product quality
- Information from regulatory authorities
APPENDIX F – MAPPING SIGNALS AND RISKS TO PBRER SECTIONS

Safety data from available information sources

Previously recognised risk?

Y

New information constituting signal?

N

No further documentation in PBRER

N

Safety signal detected?

Y

Safety signal - Section 15

N

Closed?

Y

Section 16.2

Safety signal ongoing
Section 15

N

Refuted Signal

N

Potential or Identified Risk

Important?

N

Section 16.4

Y

Key to benefit-risk evaluation?

N

Section 18.2

Y

Action(s) proposed?

N

No further documentation in PBRER

Y

Consider update to E2E document, if applicable. Update RSI as appropriate.

Important?

Y

Section 16.4

N

Potential or Identified Risk

New information on previously recognised identified/potential risk or missing information
